This is unacceptable. Water is a finite natural resource for which diminishing its quality is a completely irreversible damage: one that we cannot undo. Given this irreversibility and the dependency of millions of people on Lake Michigan as their water source, Wisconsin must require, through multiple testing schemes, that Foxconn does not release ANY level of toxic chemicals back into the lake. Under clean water laws, hazardous chemicals must be ENTIRELY removed so that our water sources are completely uncontaminated. Any uncertainty about what the strictness of standards will be is unacceptable to the millions of people whose lives all depend on the quality of Lake Michigan's water, showing that Foxconn's and our state's contentment with risking any level of pollution is representative of a completely self-serving, egocentric mindset. The ability for a Taiwanese company to determine that people living hundreds of miles away and all future generations of their children should have to deal with irreversible environmental damage and health risk is unjust because it is representative of a negative externality. All citizens near the lake and their future generations will being affected, and because Foxconn's external effects are not being taken fully into account by not requiring the water to be 100% uncontaminated, the company is not compensating these people enough for their actions. Foxconn is much too focused on its own revenues and the revenues it would generate for the 3-13k increase in jobs. The increase in jobs does not at all make up for the irreversible costs on external people because it is effecting millions more than just those Foxconn employers and employees. Promoting the project by using the creation of jobs is an unethical excuse. The 3-13k jobs are not worth the cost on society due to the irreversible damage done to our limited water supply and the harm done to the lives of millions of people and their children.
