Currently I am a student at Harborside Academy,where we have been studying the effect Foxconn will have on our surrounding water and environment. Foxconn stated that the majority of the water will be returned and treated. My main question is how will the water be treated? They have yet to state if they will use chemicals or filters. If they decide to use chemicals,how many,which ones,and how will they effect the lake? If they choose filters,what kinds and how will they effect the lake water?

Sincerely,
Ian,one of Foxconn's inquirers
