

580610

The Walleye Population in Wisconsin has been declining & stocking is next to nothing. Allowing the larger fish to be harvested makes no sense at all.

This is not an experiment! Protecting walleyes for spawning (most fish over 20") is very well known to be working.

Walleye slot size

Selective harvest for future fishing. Keeping the right fish & releasing the right fish & we will have fishing for our children & their children.

I propose that the Conservation Congress, with the Department of Natural Resources to make a rule change. A slot size on Walleyes in Wisconsin waters. 20" and up need to be returned to the water and only one over 26"

(the 20" being a standard, some body's of water may need Special slot.)
