

Equal opportunity for Buck Hunters

A crossbow season was set up in Wisconsin for two years to determine the effect of the weapon on the deer herd.

That data now clearly show's, the buck harvest percentage for firearms and archery season has remained constant in their respective seasons. Crossbow enthusiasts, hunting before the gun season, show a success rate on bucks, 40 percent higher than that of firearms and archery.

Now that the data has been collected, it would be only fair to lengthen the firearm and archery season or shorten the crossbow season for equal opportunity by all deer hunters in Wisconsin.

The resolution: that the DNR take action to adjust the length of the crossbow season.
