## 1. Site Background

On behalf of Madison-Kipp Corporation, ARCADIS has been retained to support investigation and remediation activities at its facility located at 201 Waubesa Street in Madison, Wisconsin (Site, Figure 1-1). The Site is approximately 7.5 acres in size. A 130,000-square foot building occupies much of the Site, with asphalt parking lots located in the northeastern, southwestern and southeastern portions of the Site. The building has a 25,000-square foot second floor and a 25,000-square foot basement. The Site is currently used as a metals casting facility.

The Site is located in the eastern portion of Madison, in a mixed use area of commercial, industrial and residential land use. The Site is also located at the northeast end of the Madison isthmus, approximately 1,500 feet north of Lake Monona and approximately 6,800 feet east of Lake Mendota.

Site investigation activities were initiated in 1994 in response to a request from the Wisconsin Department of Natural Resources (WDNR). Site investigations had been conducted at two adjacent properties, and WDNR requested an investigation at the Site based on the results of those investigations. The initial investigation at the Site identified chlorinated hydrocarbons in soil and groundwater. Additional investigation activities were conducted, and are still ongoing.

As part of ongoing remediation and interim actions, a soil vapor extraction (SVE) system was installed on site in March 2012 to mitigate offsite migration of vapors. During installation of the SVE system (located along the northeastern property boundary), soil was excavated to install wells and conveyance piping. Excess soil that could not be placed back in the conveyance piping trenches was stockpiled, and a waste characterization sample was collected. The sample contained detectable concentrations of polychlorinated biphenyls (PCBs). The WDNR was notified of the PCB results, and the WDNR issued a Responsible Party letter on April 19, 2012.

In a letter dated May 4, 2012, the WDNR requested a work plan for conducting an investigation to evaluate the sources, degree and extent of impacts associated with PCBs. A *Work Plan for Polychlorinated Biphenyl Investigation* dated May 21, 2012 was submitted to the WDNR for approval to complete site investigation activities associated with PCBs. The WDNR provided a *Conditional Approval* letter dated May 30, 2012 for this work plan, and investigation activities were initiated on June 1, 2012.

A summary of the PCB analytical data, consisting of data collected through June 26, 2012, was submitted to the WDNR on July 12, 2012. The PCB data was discussed in a conference call with Madison-Kipp, WDNR, and United States Environmental Protection Agency (U.S. EPA) representatives on July 12, 2012. During this conference call, the WDNR requested a work plan for conducting supplemental investigation activities to further evaluate the extent of impacts associated with PCBs.

A *Work Plan for Supplemental Polychlorinated Biphenyl Investigation* dated July 23, 2012 was submitted to the WDNR for approval to complete the requested supplemental site investigation. The WDNR provided a *Final Approval* letter dated August 6, 2012 for this work plan. In addition, the WDNR provided an *Additional Soil Investigation Requirements* letter dated August 3, 2012. This letter requested additional investigation activities, including PCB sampling, on residential properties immediately adjacent to the Site.

This document presents the results of the supplemental investigation. Based on the PCB investigations completed, recommendations for managing the identified PCBs have been developed. This work plan was developed for implementation of recommended activities associated with the on-site PCB-impacted soils.

## **1.1 Summary of PCB Investigation to Date**

### 1.1.1 Initial PCB Investigation

As part of ongoing investigation activities, starting in April 2012 and continuing as part of the WDNR-approved *Work Plan for Polychlorinated Biphenyl Investigation*, shallow soil borings were advanced in the backyards of residences adjacent to the Site. A total of 46 soil borings were advanced at 24 adjacent residences. The soil borings were completed at the residential properties using a hand auger to a depth of approximately 4 feet below ground surface (ft bgs). Soil samples were collected from each soil boring from depths of 0 to 1 ft bgs and from 3 to 4 ft bgs, and submitted for laboratory analysis of PCBs, volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), Resource Conservation and Recovery Act (RCRA) metals, and total cyanide.

Additionally, a total of 84 soil borings were advanced on-site in accordance with the WDNR-approved *Work Plan for Polychlorinated Biphenyl Investigation*. The soil borings were advanced using direct-push drilling methods or were hand augered to depths of approximately 4 to 35 ft bgs. One to two soil samples were collected from

each soil boring and submitted for laboratory analysis of PCBs, VOCs, PAHs, RCRA metals, and total cyanide.

As noted above, a summary of the PCB analytical data, consisting of data collected through June 26, 2012, was submitted to the WDNR on July 12, 2012. The PCB data was compared to the WDNR's non-industrial direct contact residual contaminant level (0.22 milligrams per kilogram [mg/kg]), the WDNR's industrial direct contact residual contaminant level (0.74 mg/kg), the U.S. EPA's self-implementing high-occupancy cleanup level with no site restrictions (1 mg/kg), and the Toxic Substance Control Act disposal limit (50 mg/kg).

#### 1.1.2 Supplemental PCB Investigation

Supplemental PCB investigation activities were completed during the period of August 6 through 15, 2012, and consisted of advancement and sampling of 32 soil borings on site along the eastern fence line, and 22 soil borings on site in the parking lot. The soil borings were advanced by hand auger techniques (along the fence line) or by direct push drilling methods (in the parking lot). Soil samples were collected from each soil boring from depths of 0 to 2 ft bgs and/or from 2 to 4 ft bgs, and submitted for laboratory analysis of PCBs by Method 8082. A summary of the on-site data collected to date is presented in Table 1-1, and shown on Figures 1-2 through 1-4.

All of the soil samples collected from along the eastern fence line adjacent to the residential properties (Soil Borings B-102 through B-133) from both the 0 to 2 ft bgs and 2 to 4 ft bgs sampling intervals contained concentrations of PCBs below laboratory detection limits or below the U.S. EPA's high occupancy cleanup level of 1 mg/kg (Figures 1-2 and 1-3).

Soil Borings B-13b, B-14b, B-15b, B-17b, B-40b, and B-85 through B-101 were advanced to further delineate the PCBs on-site (Figures 1-2 and 1-3). The soil samples collected from Soil Borings B-87 through B-90, B-92, B-94 and B-96 through B-99 contained PCB concentrations below laboratory detection limits or below 1 mg/kg in the 0 to 2 ft bgs sample range. Soil samples collected from Soil Borings B-85, B-86, B-91, B-93, B-95 and B-100 contained PCB concentrations above 1 mg/kg, but below 50 mg/kg in the 0 to 2 ft bgs sample range. The soil sample collected from Soil Boring B-101 (0 to 2 ft bgs) was the only sample that contained PCB concentrations above 50 mg/kg (Figure 1-2). Figure 1-2 depicts the PCB results for the soil samples collected from 0 to 2 ft bgs.

The soil samples collected from the 2 to 4 ft bgs range from the 22 on-site borings (B-13b, B-14b, B-15b, B-17b, B-40b, and B-85 through B101) contained concentrations of PCBs below laboratory detection limits or below 1 mg/kg, with the exception of Soil Borings B-93 (2 to 4 ft bgs) and B-101 (2 to 4 ft bgs). The soil sample collected from Soil Boring B-93 (2 to 4 ft bgs) contained a detection of PCBs at 2.7 mg/kg and the soil sample collected from Soil Boring B-101 (2 to 4 ft bgs) contained a detection of PCBs at 5.8 mg/kg. Figure 1-3 depicts the PCB results for the soil samples collected from 2 to 4 ft bgs.

The supplemental investigation activities have confirmed that PCBs are not present at the Site eastern property line above 1 mg/kg, and the areas on-site containing PCB concentrations above 50 mg/kg have been delineated and are limited to 0 to 2 ft bgs.

#### 1.1.3 Additional On-Site Investigation Activities

As part of the *Work Plan for Polychlorinated Biphenyl Investigation* scope of work, soil borings were also advanced on-site within the southwest corridor during August 2012. The soil borings were advanced by hand auger, and soil samples were collected from Soil Borings W-4 through W-15 and W-17 from the 0 to 1 and 3 to 4 ft bgs intervals and submitted for laboratory analysis of PCBs, VOCs, PAHs, RCRA metals and total cyanide. Twelve of the 23 soil samples contained PCB concentrations below laboratory detection limits or below 1 mg/kg in the 0 to 2 and/or 2 to 4 ft bgs sample range. Eleven soil samples, collected from Soil Borings W-5, W-6, W-7, W-9, W-10, W-12, W-14, and W-15, contained PCB concentrations above 1 mg/kg, but below 50 mg/kg in the 0 to 2 and/or 2 to 4 ft bgs sample range. A summary of the soil analytical results from the on-site investigation activities in the southwest corridor is presented in Table 1-1 and depicted on Figures 1-2 and 1-3.

Additionally, the *Work Plan for Polychlorinated Biphenyl Investigation* scope of work contained a provision for additional PCB laboratory analysis of select soil samples by PCB homolog Method 680. The WDNR approved 12 soil samples for PCB homolog analysis in electronic correspondence dated July 26, 2012. The results of the homolog analysis were compared to the PCB laboratory analytical results obtained with Method 8082 for the same soil samples. In all cases, the PCB homolog analytical results were lower than the PCB results reported by Method 8082. Thus, utilizing the PCB results by Method 8082 provides a conservative approach to the remedial recommendations provided below. A summary of the PCB homolog analytical data for the 12 soil samples is presented in Table 1-1.

#### 1.1.4 Additional Off-Site Investigation Activities

In accordance with the *Additional Soil Investigation Requirements* letter provided by the WDNR, soil samples were collected from the residential properties along South Marquette Street (from 206 through 230 South Marquette Street) and analyzed for PCBs as well as VOCs, PAHs, RCRA metals, and total cyanide in August 2012. PCBs were not detected above laboratory detection limits, above 1 mg/kg, or above 0.22 mg/kg (the WDNR's non-industrial direct contact residual contaminant level) in any of these soil samples. The details of the off-site investigation activities, including the laboratory results for VOCs, PAHs, RCRA metals, and total cyanide, were provided in the *Off-Site Soil Investigation Report* submitted to WDNR on October 9, 2012.

To summarize the PCB off-site investigation data, a total of 121 soil samples were collected from 32 off-site residential properties from June through August 2012. Two off-site residential properties (237 and 269 Waubesa Street) have not been sampled as access has not been granted by these property owners. Of the soil samples collected, PCBs were not detected above laboratory detection limits, above 1 mg/kg, or above 0.22 mg/kg in any of the 121 soil samples collected from the 32 off-site residential properties.

A summary of the soil analytical results from the off-site investigation activities is presented in Table 1-2 and depicted on Figures 1-2 and 1-3. Copies of all soil boring logs, abandonment forms, and laboratory reports will be submitted with the comprehensive Site Investigation Report.

## 2. Overview of Recommended Activities

The following presents a description of the work to be completed in relation to PCBs at the Site:

- On-site soils containing PCBs at concentrations above 50 mg/kg will be excavated and disposed of at a Toxic Substances Control Act approved landfill. There are two recommended excavation areas as shown on Figure 2-1. These excavation areas encompass soil samples with total detected PCBs above 50 mg/kg at depths of 0 to 2 ft bgs.
- A combination of engineering and institutional controls (deed notification) will be utilized for soils left in-place on-site containing concentrations of PCBs between 1 and 50 mg/kg.
- To further define the PCB detections present within the southwest corridor on site, additional soil borings are proposed to be advanced on the off-site residential properties.

### 3. Work Plan

The following sections present a description of the work to be completed during the supplemental investigation.

#### 3.1 Health and Safety

Prior to beginning the investigation, the Site health and safety plan will be updated to address the planned field activities. Utility marking arrangements will be made through Digger's Hotline (the State of Wisconsin Public Utility clearance service), a ground penetrating radar survey, a private utility locator, and discussions with property owners. Prior to beginning work each day, a "tailgate" health and safety briefing will be held to discuss the activities and identify ways to ensure the health and safety of Site workers. If conditions are encountered during Site investigation activities that differ from those outlined in the health and safety plan, the Site activities will be re-evaluated to determine the appropriate actions that will ensure the health and well-being of the workers.

#### 3.2 Soil Excavation

- On-site soils containing PCBs at concentrations above 50 mg/kg will be excavated and disposed of at a Toxic Substances Control Act approved landfill. There are two recommended excavation areas as shown on Figure 2-1. These excavation areas encompass soil samples with total detected PCBs above 50 mg/kg at depths of 0 to 2 ft bgs.
  - Locate and clear utilities, including ground penetrating radar (Ground Penetrating Radar Services), private utility locate (Private Lines, Inc.), and Digger's hotline to clear the excavation limits.
  - Excavate, transport, and dispose of soils from two locations. One excavation is centered around Soil Boring B-40 and measures approximately 40 feet long by 42 feet wide by 2 feet deep (Figure 2-1). A second excavation will include the excavation from approximately Soil Boring B-13 to B-18 and measures approximately 112 feet long by 30 feet wide by 2 feet deep. The soils will be disposed at Wayne Disposal located in Belleville, Michigan.
  - Confirmation soil samples will be collected from approximately every 5 feet along the side walls of the excavation areas. Approximately 36 samples will be collected from the area around Soil Boring B-40, and approximately 63

samples will be collected from the area around Soil Borings B-13 through B-18. Samples will be collected in clean, laboratory-supplied sample containers, and placed in a cooler filled with ice. Each sample will be submitted for laboratory analysis of PCBs by U.S. EPA SW-846 Method 8082. The samples will be submitted using appropriate chain-of-custody procedures. Due to the number of pre-excavation samples collected along the eastern property boundary, additional samples will not be collected from that side of the excavation.

- Confirmation soil samples will be collected from approximately every 8 feet (2.5 meters) from the base of the excavation areas. Approximately 72 samples will be collected from the base of the area around Soil Boring B-40 and approximately 135 samples will be collected from the base of the area around Soil Borings B-13 through B-18. Samples will be collected in clean, laboratory-supplied sample containers, and placed in a cooler filled with ice. Each sample will be submitted for laboratory analysis of PCBs by U.S. EPA SW-846 Method 8082. The samples will be submitted using appropriate chain-of-custody procedures.
- Limited soil may need to be stockpiled on site to accommodate the safe removal of the soils over the electric line. ARCADIS will coordinate oversight by Madison Gas and Electric (MG&E) personnel, if MG&E requires on-site personnel. If soil is stockpiled, the soil will be placed on and covered with polyethylene plastic sheeting.
- The excavations will be backfilled with crushed stone and compacted in a maximum of 6-inch lifts using a vibrating plate compactor. Asphalt replacement will be handled directly by Madison-Kipp.

### 3.3 Engineering and Institutional Controls

A combination of engineering and institutional controls (WDNR soil geographic information system registry) will be utilized for soils left in-place on-site containing concentrations of PCBs between 1 and 50 mg/kg.

- The engineered barrier will consist of the existing asphalt and concrete pavement and/or at least 2 feet of clean fill for landscaped areas.
- Impacted soil left in place will be managed in accordance with a Soil Management Plan and Engineered Barrier (Cap) Maintenance Plan.

- A Soil Management Plan will be prepared documenting the location of impacted soils at the site, and recommended procedures, handling, and/or disposal practices necessary should below ground work be conducted in areas with impacted soils. The Soil Management Plan will describe procedures to be followed if impacted soils are encountered or removed during facility maintenance or construction activities. Managing soils appropriately will provide continued protection of human health and the environment by minimizing potential exposure to the residual contamination in the impacted soils.
- An Engineered Barrier (Cap) Maintenance Plan will be prepared documenting the location of PCB-impacted soils left in-place, the engineering controls utilized as a direct contact barrier, and required maintenance and inspection activities. The WDNR's Maintenance Plan Template will be utilized to prepare this plan.
- A fence (with signage) will be maintained between the Site and adjacent residential properties.
- Institutional controls may include registration with the WDNR soil geographic information system, and/or a deed notification that will be used to notify current and future site owners of the presence and location of soil impacts.

### **3.4 Soil Boring Sampling and Analysis Plan**

To further define the PCB detections present within the southwest corridor on site, additional soil borings are proposed to be advanced on the off-site residential properties. Two soil borings will be advanced on each off-site residential property within 5 feet of the fence line (233 through 269 Waubesa Street) using a hand auger. To date, access has not been granted to perform work at 237 and 269 Waubesa Street. Soil borings will be collected from 0 to 1 and 3 to 4 ft bgs and submitted for analysis of PCBs by U.S. EPA SW-846 Method 8082. Figure 3-1 shows the locations of the proposed soil borings.

If the soil samples contain PCB concentrations less than 0.22 mg/kg, no further action is necessary for the residential properties and an engineered barrier will be installed for the portion of the on-site Kipp property with PCB concentrations above 1 mg/kg.

### 3.5 Management of Investigative-Derived Wastes

Soil cuttings and decontamination water from cleaning equipment generated during the investigation will be containerized in appropriate steel 55-gallon drums. Arrangements will be made with a licensed disposal facility for the transportation and disposal of the wastes.

### 3.6 Quality Assurance (QA)

In accordance with U.S. EPA requirements, this section provides the QA, quality control (QC), and technical activities and procedures associated with implementing this Work Plan. The four elements associated with this section include Project Management, Data Generation and Acquisition, Assessment/Oversight, and Data Validation and Usability.

#### 3.6.1 Project Management

ARCADIS is the technical consultant for implementation of this Work Plan. ARCADIS has technical responsibility for data collection. The ARCADIS Project Manager is responsible for ensuring that the project objectives are achieved. The following provides the responsibilities of the Project Manager for implementation of this Work Plan:

##### *Project Manager*

- Technical representation for Madison-Kipp
- Overview of field activities
- Overview of laboratory activities
- Advise on corrective actions
- Preparation and review of reports
- Coordinate the ARCADIS technical group
- Final evidence file custodian
- Approval of quality assurance

The analytical laboratory's Project Manager is responsible for ensuring that the project objectives are achieved by the laboratory. The laboratory selected for this project is TestAmerica Laboratories, Inc. (TestAmerica). Laboratory services shall be provided by TestAmerica's laboratory in University Park, Illinois. TestAmerica's Project Manager responsibilities include:

- Ensure all resources of the laboratory are available on an as-required basis
- Review of final analytical reports
- Approve final reports prior to submission to ARCADIS

The U.S. EPA Region 5 Project Manager and WDNR Project Manager are responsible for overview of this project on behalf of the U.S. EPA and WDNR.

Project team members with QA responsibilities include the following:

*QA Officer – ARCADIS*

- Oversee and review field QA/QC
- Review laboratory QA/QC
- Coordinate data validation and assessment
- Conduct detailed data review
- Advise on laboratory corrective action procedures, if necessary
- Preparation and review of QA reports
- QA/QC representation of project activities
- Approval of QA

*Field QA Officer – ARCADIS*

- Management of field activities and field QA/QC

- Field data assessment
- Internal field technical system audits
- Technical representation of field activities
- Preparation of standard operating procedures for field activities
- Implement and document field corrective actions, if necessary
- Approval of QA

ARCADIS will conduct all field sampling and obtain field measurements related to sampling during implementation of this Work Plan. The specific procedures for field sample collection and field measurements are presented below. Location coordinates will be collected using a combination of measuring tape, stakes, and surveying for location of soil samples. The ARCADIS field sampling team will consist of technical staff coordinated from the ARCADIS Milwaukee office. The ARCADIS Field QA Officer will be responsible for documenting any non-conformance and subsequent corrective actions.

ARCADIS field sampling team members are required to have received the 40-hour Hazardous Waste Operations and Emergency Response safety training and annual 8-hour refresher courses required by 29 CFR Parts 1910 and 1926. On-site subcontractor personnel involved in invasive activities (excavation) are required to have received the same training.

*TestAmerica*

TestAmerica located in University Park, Illinois will perform analyses of samples collected during the site activities. Samples will be analyzed for PCBs by Protocol SW846, U.S. EPA Method 8082. All samples analyzed for PCBs will be determined as Aroclors. The specific responsibilities of laboratory personnel include:

*Laboratory – Operations Managers*

- Coordinate laboratory analyses
- Supervise in-house chain-of-custody

- Schedule sample analyses
- Oversee data review
- Oversee preparation of analytical reports

*Laboratory – Sample Custodians*

- Receive and inspect the incoming sample containers
- Record the condition of the incoming sample containers
- Sign appropriate documents
- Verify correctness of chain-of-custody documentation
- Notify project manager of any non-conformance identified during sample receipt and inspection
- Assign a unique identification number and customer number, and enter each into the sample receiving log
- Initiate transfer of the samples to appropriate lab sections
- Control and monitor access/storage of samples and extracts

The subcontractor is responsible for compliance of their personnel with the applicable regulations. TestAmerica personnel training records are maintained by the laboratory. TestAmerica is a certified Wisconsin laboratory (ID# 999580010). The surveyor used for this project, if necessary, will be a Wisconsin-licensed surveyor.

3.6.2 Data Generation and Acquisition

A summary of the proposed sampling strategy is presented above in Section 3.2. Additional data collection activities and measurement performance criteria for the activities, as related to quality, are presented in this section.

Measurement performance criteria for precision, accuracy, representativeness, completeness, and comparability are provided for reference.

Precision is defined as the measure of agreement among repeated measurements of the same property under identical or substantially similar locations. Precision of the field sample collection procedures will be assessed by the data from analysis of the field duplicate samples. Relative percent differences (RPDs) will be calculated for detected analytes from field duplicate sample sets. Field duplicate samples will be collected at a minimum frequency of 1 per 20 investigative samples. RPDs of 50 percent will be used as advisory limits. Professional judgment will be used for any data qualification.

Laboratory precision will be assessed through the calculation of RPDs for replicate/duplicate sample analyses. In general, these will be matrix spike/matrix spike duplicate (MS/MSD) for soil samples.

Accuracy is a measure of the overall agreement of a measurement to a known value. Potential factors that could affect the accuracy of a sample analysis include the sampling process, field contamination, preservation, handling, variability within the sample matrix, sample preservation, and analysis techniques. Field sampling accuracy will be assessed by the data from the field blank samples.

Equipment blank samples will be collected at a frequency of one per ten sampling equipment decontamination procedures or at least once per day of sampling equipment cleanings, whichever is more frequent. Equipment blank samples will be collected by routing laboratory provided deionized water through decontaminated sampling equipment. Equipment blank samples will be analyzed to check procedural contamination and/or ambient conditions and/or sample container contamination at the site that may cause sample contamination. Accuracy will be ensured by adhering to all sample handling procedures, sample preservation requirements, and holding time periods.

Laboratory accuracy will be assessed by determining percent recoveries from the analysis of laboratory control samples. Accuracy relative to the sample matrix will be assessed by determining percent recoveries from the analysis of MS/MSD samples. MS/MSD samples will be collected/designated for the analysis at a minimum frequency of 1 per 20 or fewer samples.

Representativeness expresses the degree to which the data accurately and precisely represent a characteristic of a population, parameter variations at a sampling point, a process condition, or an environmental condition. Representativeness is a qualitative parameter which is dependent upon the proper design of the sampling program and proper laboratory protocol. Representativeness will be satisfied by ensuring that the

sampling procedures are followed, proper sampling techniques are used, proper analytical procedures are followed, and holding times of the samples are not exceeded in the laboratory.

The representativeness criteria for laboratory data will be to ensure that the proper analytical procedures are used for sample preparation (e.g., homogenizing the sample prior to subsampling), sample analysis, and that sample holding times are met. Additionally, the accuracy and precision of the laboratory data affect representativeness. The laboratory representativeness criteria will include achieving the accuracy and precision criteria for the sample analyses.

Comparability expresses the confidence with which one data set can be compared with another. The criteria for field comparability will be to ensure and document that the sampling networks designed for this Work Plan is properly implemented.

The criteria for laboratory data comparability will be to ensure that the analytical methods used for the proposed sampling and analysis events are comparable to the methods used for previous sampling events. The methods identified in this Work Plan are comparable to the methods used to generate data for previous investigations.

Completeness is defined as the percentage of measurements made which are judged to be valid measurements compared to the total number of measurements. The criteria for field completeness will be that a minimum of 90 percent of the field measured data are valid.

The criteria for laboratory completeness will be that a minimum of 90 percent of the laboratory data will be determined to be valid (usable) for the intended purpose.

Sensitivity is the capability of a method or instrument to discriminate between small differences in analyte concentrations. Instrument detection limits and practical quantitation limits are the objective measures of instrument sensitivity. Instrument sensitivity during a specific analysis is monitored by the analyses of method blanks, calibration check samples, and laboratory control samples. Sensitivity is evaluated by the minimum concentration that can be measured by a method (method detection limit), by an instrument (instrument detection limit), or by a laboratory (quantitation limit).

### 3.6.2.1 Records

Documents and records generated during the implementation of the Work Plan include sample collection records, QC sample records, field measurement records, laboratory records, and data handling records. Sample collection records include field logbooks, chain-of-custody records, and shipping papers. QC sample records include field logbooks for recording blank samples and field duplicates. Laboratory records include sample receipt documentation, chain-of-custody documentation, sample container cleanliness certifications, sample analysis records, instrument/raw data, QC data, calibration data, and final reports.

Laboratory reports will consist of the Case Narrative and Chemistry Data Package.

### 3.6.3 Assessment/Oversight

Assessments consisting of internal and external audits may be performed during the project. Internal technical system audits of both field and laboratory procedures will be conducted to verify that sampling and analysis are being performed in accordance with the established procedures. External field and laboratory audits may be conducted by the U.S. EPA.

An internal field technical system audit of field activities, including sampling and field measurements, will be conducted by the Field QA Officer or their designee at the beginning of the field sampling activities to identify deficiencies in the field sampling and documentation procedures. The field technical system audit will include examining field sampling records, field instrument operating records, field instrument calibration records, and chain-of-custody documentation. In addition, sample collection, handling, and packaging in compliance with the established procedures will be reviewed during the field audit. Any deficiencies identified will be documented and corrective actions will be taken to rectify the deficiencies.

Corrective action resulting from internal field technical system audits will be implemented immediately if data may be adversely affected due to unapproved or improper use of approved methods. The Field QA Officer will identify deficiencies and recommend corrective action to the Project Manager. Implementation of corrective actions will be performed by the Field QA Officer and field team. Corrective action will be documented in the field logbook and/or project file. Follow-up audits will be performed as necessary to verify that deficiencies have been corrected, and that the

QA/QC procedures described in this document are maintained throughout implementation of this Work Plan.

An external field technical system audit may be conducted by U.S. EPA Region 5 Field Support Section any time during the field operations. These audits may or may not be announced and will be conducted at the discretion of the U.S. EPA Region 5.

An internal laboratory technical system audit will be conducted by the TestAmerica QA Officer or designee. The laboratory technical system audit is conducted on an annual basis and includes examining laboratory documentation regarding sample receiving, sample log-in, storage and tracking, chain-of-custody procedures, sample preparation and analysis, instrument operating records, data handling and management, data tracking and control, and data reduction and verification. The laboratory QA Officer will evaluate the results of the audit and provide a final report to section managers and the Operations Manager that includes any deficiencies and/or noteworthy observations.

Corrective action resulting from deficiencies identified during the internal laboratory technical system audit will be implemented immediately. The Operations Manager or section leaders, in consultation with the laboratory supervisor and staff, will approve the required corrective action to be implemented by the laboratory staff. The laboratory QA/QC Officer will ensure implementation and documentation of the corrective action. All problems requiring corrective action and the corrective action taken will be reported to the laboratory Project Manager. Follow-up audits will be performed as necessary to verify that deficiencies have been corrected, and that the QA/QC procedures described in this QA section are maintained.

An external laboratory audit may be conducted by U.S. EPA Region 5 Field Support Section personnel. These audits may or may not be announced and are at the discretion of the U.S. EPA Region 5. The external laboratory audits will include, but not be limited to, reviewing laboratory analytical procedures, laboratory on-site audits, and/or submitting performance evaluation samples to the laboratory for analysis.

An external laboratory audit may be conducted at least once prior to the initiation of the sampling and analysis activities.

QA Management Reports will be prepared during implementation of this Work Plan. These QA Management Reports will be included with the bi-monthly progress reports that are submitted to WDNR and U.S. EPA. These reports will include project status, results of performance evaluations and any system audits, results of periodic data

quality validation and assessment and data use limitations, and any significant QA problems identified and corrective actions taken.

The ARCADIS QA Officer will be responsible within the organizational structure for preparing these reports. The ARCADIS Project Manager will be provided with these reports for distribution with the bi-monthly progress reports. The final Work Plan documentation report will also include a separate QA/QC section that will summarize data quality information contained in the bi-monthly progress reports and overall data quality assessment.

#### 3.6.4 Data Validation and Usability

The QA activities that will be performed to ensure that data are scientifically defensible, properly documented, of known quality, and meet the project objectives are described in the following sections.

All field and laboratory data will be reviewed and verified/validated. The procedures and criteria used to verify and validate field and laboratory data will consist of evaluating the data to the measurement of performance criteria presented in Section 3.6.2. Field data and logbooks will be reviewed to ensure that the requirements of the sampling program, including the number of samples and locations, sampling procedures, and sample handling, were fulfilled. Acceptable departures from the planned sampling program, such as collecting a sample from an adjacent location because of a subsurface obstruction, will not impact the data usability.

Sample collection procedures will be reviewed for compliance with the requirements of the QA program. If alternate sampling procedures were used, the acceptability of the procedure will be evaluated to determine the affect on the usability of the data. Data usability will not be affected if the procedure used is determined to be an acceptable alternative that fulfills the measurement performance criteria.

Sample handling records will be reviewed to ensure that sample integrity remained intact from collection to laboratory receipt and that samples were properly preserved. Chain-of-custody documentation and sample condition upon laboratory receipt will be reviewed. The data from samples for which the chain-of-custody or sample identification cannot be verified will be rejected. The data for samples that were not properly preserved will be qualified or rejected depending on the severity of the deviation from the requirements.

Field and laboratory data will be verified to ensure that the methods used to analyze the samples were consistent with the QA requirements. Data generated from the use of unapproved methods will be rejected. Acceptable departures from the methods specified include using an alternate field meter of comparable capability if the specified meter becomes inoperable.

QC data will be reviewed to determine compliance with the acceptance criteria presented above. QC data that do not meet acceptable criteria will result in sample data qualification. Significant departures from the QC acceptance criteria may result in rejected data.

Field data will be verified by reviewing field documentation and chain-of-custody records. TestAmerica will internally verify the laboratory data by reviewing and documenting sample receipt, sample preparation, sample analysis, data reduction, and reporting. Any deviations from the acceptance criteria, corrective actions taken, and data determined to be of limited usability will be noted in the case narrative of the laboratory report.

Data validation will be conducted by ARCADIS QA personnel consistent with the procedures identified above. The data verification/validation procedure will identify data as being acceptable, of limited usability, or rejected. Data determined to be unusable may require that corrective action be taken. Potential types of corrective action may include re-sampling by the field team or re-analysis of samples by the laboratory.

### **3.7 Reporting**

A summary report will be prepared documenting implementation of the work plan activities. This report will also include the Soil Management Plan, Engineered Barrier (Cap) Maintenance Plan, and copies of all soil manifests.

**Table 1-1. Summary of On-Site Analytical Results, Madison-Kipp Corporation, Madison, Wisconsin.**

Only detected constituents are noted. Constituent concentrations are reported as milligrams per kilogram (mg/kg).

100	Exceeds the WDNR's soil to groundwater pathway residual contaminant level.
100	Exceeds the WDNR's non-industrial direct contact residual contaminant level.
100	Exceeds the WDNR's industrial direct contact residual contaminant level.
100	Exceeds the Toxic Substance Control Act disposal limit.
100	Exceeds the EPA's self-implementing high-occupancy cleanup level with no site restrictions.
*	Laboratory Control Spike or Laboratory Control Spike Duplicate exceeds the control limits.
<	Constituent not detected above noted laboratory detection limit.
^	Instrument related quality control exceeds the control limits.
B	Compound was found in the blank and sample.
EPA	United States Environmental Protection Agency
J	Constituent concentration is an approximate value.
NA	Not analyzed.
NE	Criteria not established.
ND	Total PCBs less than the laboratory detection limit.
PAH	Polycyclic Aromatic Hydrocarbons.
PCBs	Polychlorinated biphenyls.
RCL	Residual contaminant level.
TSCA	Toxic Substance Control Act.
VOCs	Volatile organic compounds.

Footnotes on Page 27.

**Table 1-2. Summary of Off-Site Soil Analytical Results, Residential Properties, Madison-Kipp Corporation, Madison, Wisconsin.**

Only detected constituents are noted. Constituent concentrations are reported as milligrams per kilogram (mg/kg).

<b>100</b>	Exceeds the WDNR's non-industrial direct contact residual contaminant level.
<b>100</b>	Exceeds the WDNR's industrial direct contact residual contaminant level.
*	Laboratory Control Spike or Laboratory Control Spike Duplicate exceeds the control limits.
<	Constituent not detected above noted laboratory detection limit.
J	Constituent concentration is an approximate value.
B	Compound was found in the blank and sample.
EPA	United States Environmental Protection Agency
L	Laboratory Control Sample and/or Laboratory Control Sample Duplicate recovery was above the control limits. Analyte not detected, data not impacted.
M1	The MS and/or MSD were outside control limits.
NA	Not analyzed.
NE	Criteria not established.
ND	Total PCBs less than the laboratory detection limit.
PAH	Polycyclic Aromatic Hydrocarbons.
PCBs	Polychlorinated biphenyls.
RCL	Residual contaminant level.
TSCA	Toxic Substance Control Act.
V	Serial dilution exceeds the control limits.
VOCs	Volatile organic compounds.

NOTE:  
 TOPO BASE MAP OBTAINED FROM  
 ESRI ONLINE MAPPING, USING  
 ARCMAP 10 ACCESSED 10/19/2012

MADISON-KIPP CORPORATION
