Breeding Season Movement
Adult Male White-tailed Deer

This map displays radio telemetry locations from April through November of 2011 for deer #1091. This particular deer was captured in Shawano County, Wisconsin, as an adult male on February 17, 2011, and was harvested during the firearm deer hunting season on November 20, 2011. The significant movement of almost 2 miles away from his roughly 1.5 square mile "core area" illustrates the interesting movements during the white-tailed deer breeding season in early November. Movements such as these can make male white-tailed deer more susceptible to harvest.
