

Interim Forest Management Plan

Dodge & Jefferson Counties – Scattered Properties

Property Identifiers

Property Name and Designation (multiple small properties can be grouped):

DODGE COUNTY PROPERTIES: Gift Lands – Dodge County, REM – Beaver Dam Lake, Dodge County Scattered Wildlife Habitat & Dodge County Extensive Wildlife Habitat, Glacial Habitat Restoration Area, Fox Lake Fishery Area, and Westford Marsh Wildlife Area

JEFFERSON COUNTY PROPERTIES: REM – Golden Lake, Bark River Hatchery, Jefferson County Statewide Wildlife Habitat & Arkin Marsh Public Hunting Grounds

Forestry Property Code(s):

DODGE COUNTY PROPERTIES: 1402, 1403, 1404, 1406, 1407, 1409 & 1445

JEFFERSON COUNTY PROPERTIES: 2806, 2807, 2809, & 2810

Property Location - County: **DODGE & JEFFERSON**

Property Acreage: **DODGE: 2,941 JEFFERSON: 429**

Master Plan Date: **None**

Property Manager(s): **Paul Samerdyke (Dodge Co), James Chistopoulos (GHRA properties), Sam Jonas (Jefferson Co), Laura Stremick-Thompson (Fisheries properties)**

Part 1: Property Assessment

The following should be considered during the property assessment. Not all sections may be relevant for all properties.

A. ECOLOGICAL LANDSCAPE AND PROPERTY CONTEXT

All of the listed properties are located within the Southeast Glacial Plains Ecological Landscape which is made up of glacial till plains and moraines. Soils tend to be lime-rich tills overlain by silt-loam loess. Historically the landscape provided a mixture of prairie, oak forests and savanna and maple basswood forests. End moraines and drumlins largely supported savannas and forests. Wet-mesic prairies, southern sedge meadows, emergent marshes and calcareous fens are also found within the landscape. In terms of hydrology and aquatic productivity, this Ecological Landscape is among the highest in the state. Major river systems include the Rock, Bark, and Crawfish and several lake chains also exist. Extensive marshes, fens, sedge meadows, wet prairies, tamarack swamps and floodplain forests are also significant features found within this landscape.

Prior to European settlement less than half of the Dodge and Jefferson County land area was forested. Since Euro-American settlement, large portions of the Southeast Glacial Plains have been intensively developed for agricultural or urban-industrial uses, significantly altering the historical vegetation. The hydrology of this Ecological Landscape has been greatly altered and affected by modifications (ditching, diking, tiling), grazing, invasive plants, excessive inputs of sediment- and nutrient-laden runoff from croplands and human development. Remaining forests today occupy only about 10% of the land area and consist of maple-basswood, lowland hardwoods and oak. Most of the rare or natural communities that remain are associated with large moraines or in areas where the Niagara Escarpment occurs close to the surface.

The Dodge and Jefferson County properties identified have a number of Landtype Associations (222Ke02 East Johnstown-Milton Moraines, 222Ke03 South Kettle Moraines, 222Ke08 Dane-Jefferson Drumlins and Lakes, 222Ke09 Jefferson Lake Plains, 222Ke10 Oconomowoc Lakes, 222Ke12 Beaver Dam Drumlins, 222Ke13 Watertown Drumlins, 222Ke14 Allenton Drumlins,

Interim Forest Management Plan

Dodge & Jefferson Counties – Scattered Properties

222Ke16Ladoga Till Plain, 222Ke17 Horicon Marsh, and 222Ke18 Brownsville Till Plain). This landscape is typified by a nearly level lake plain with areas of undulating topography of glacial till plains, moraines, drumlins, eskers and kettles. Soils are predominantly poorly to moderately well drained silty, loamy and clayey soils. None of the properties are located in a Conservation Opportunity Area nor are they identified as an Important Bird Area.

B. GENERAL PROPERTY DESCRIPTION – MANAGEMENT, ADJACENT LAND USES, TOPOGRAPHY, SOILS, ETC.

The acreage in Dodge and Jefferson Counties consist of 12 properties scattered across both counties. These are relatively small properties with somewhat limited management opportunities based on acreage and access constraints. Much of the current forested acreage has been degraded by poor past management (e.g., over-grazing, unsustainable harvesting practices) or the introduction of invasive non-native plants.

In Dodge County the dominant land cover type for these properties is lowland brush, which accounts for 966 acres or 56% of the total property acreage. The next most significant land cover types are forest cover (299 acres, 18%), emergent vegetation (135 acres, 8%), and lowland grass (123 acres, 7%). Grasslands account for 93 acres (5%). Remaining cover types include farmland, upland brush, and open water. Much of the properties are dominated by muck or silty clay loam soils in the bottomlands. In the uplands most soil is well drained silt loam. Some intermediately drained silty clay loams also exist.

In Jefferson County there are 7 properties scattered throughout 5 townships of Jefferson County included in this plan. These are relatively small properties with somewhat limited management opportunities based on acreage limitations. Land total acreage in Jefferson County is 372,938 acres. According to the "Jefferson County Land and Water Resource Plan for 2011 to 2020", agricultural land totaled 206,914 acres or 55.5% of the total land surface, wetlands totaled 56,277 acres (15.1%), developed lands totaled 52,987 acres (14.1%), upland forest totaled 25,192 acres (6.8%), and open water totaled 17,440 acres (4.7%). Much of the current forested acreage has been degraded by poor management in the past or introduction of invasive exotic plants. Examples of poor forest management practices that result in degraded stands include pasturing or unsustainable harvesting practices.

C. CURRENT FOREST TYPES, SIZE CLASSES AND SUCCESSIONAL STAGES

In Dodge County, of the total acreage (2,941 acres) of properties included in this plan only 156 acres or 5% of the land cover is forested. Of the total forested acreage 44 acres (28%) is typed as northern hardwoods, 40 acres (26%) as oak, 31 acres (20%) as bottomland hardwoods, 15 acres (10%) as central hardwoods, 13 acres (8%) as miscellaneous deciduous (primarily boxelder), 8 acres (5%) as white pine, and 5 acres (3%) as aspen.

In Jefferson County, of the total acreage (429 acres) of properties included in this plan 133 acres or 31% of the land cover is forested. Of the total forested acreage 86 acres (65%) is typed as bottomland hardwoods, 9 acres (7%) as central hardwoods, 20 acres (15%) as northern hardwoods, 3 acres (2%) as oak, 7 acres (5%) as aspen, and the remaining 8 acres (6%) as mixed conifers. Well over half are bottomland or swamp hardwoods. These types are often dominated by green or black ash, which will be severely impacted by the emerald ash borer as it continues to spread. At the time of writing this document (September 2016) emerald ash borer is already well established throughout much of southern Jefferson County and continues to spread throughout the county.

Interim Forest Management Plan

Dodge & Jefferson Counties – Scattered Properties

D. NHI: ENDANGERED, THREATENED, SPECIAL CONCERN SPECIES, SPECIES OF GREATEST CONSERVATION NEED (SGCN)

There are a number of threatened, endangered and special concern species associated with these and other DNR properties. **For the purpose of implementing forest management practices on a given property, NHI screening protocols will be conducted for proposed sites and species guidance protocols will be followed prior to and during any current and future management activities.** If a threatened or endangered species is documented within 1 mile (for terrestrial and wetland species) or 2 miles (for aquatic species) of the proposed management site, a determination is made as to whether the species listed will be actually affected by the proposed management actions. If the species could be negatively impacted, steps will be taken to minimize or mitigate any impacts. Specific management guidelines have been developed for many species by the Bureau of Natural Heritage Conservation, and guidelines are continuously being developed for additional species.

E. WILDLIFE ACTION PLAN CONSERVATION OPPORTUNITY AREAS (COA)

While there are a number of identified Conservation Opportunity Areas in Dodge and Jefferson Counties listed in the 2015 Wisconsin Wildlife Action Plan, none of the included properties for this plan overlap with those areas.

F. SIGNIFICANT CULTURAL OR ARCHEOLOGICAL FEATURES

According to the Wisconsin Historical Society database, a review of the properties revealed several cultural or archeological sites scattered throughout the properties. Sites include mounds, villages and known burial sites. Standard procedure calls for known sites to be protected during forest management operations. If and when forest management practices are conducted on known archaeological sites, operations are conducted only during frozen ground and no ground disturbance is allowed.

G. INVASIVE SPECIES

As is the case with many portions of the Southeast Glacial Plains Ecological Landscape many of these properties are heavily infested with invasive non-native vegetation. Species that are abundant and problematic on forested portions of the Dodge and Jefferson County properties include common buckthorn, various varieties of invasive honeysuckle, garlic mustard, barberry, multi-flora rose, autumn olive and reed canary grass. Other invasive non-native species that are also problematic include glossy buckthorn, barberry, multi-flora rose, teasel, Japanese hedge parsley, wild parsnip, and Japanese knotweed. Herbicides are typically used to control invasive non-native vegetation for a variety of reasons, but most often to facilitate regeneration of desirable native vegetation.

The emerald ash borer has been detected in both Dodge and Jefferson Counties. This invasive non-native pest is expected to kill 99 percent of all ash trees within the affected area over time. Those forest stands that are dominated by ash will be identified and managed in such a way to encourage establishment of native tree species other than ash. Management of these stands may include timber harvesting, control of invasive non-native vegetation, and tree planting. Some areas that are not easily accessible or are already degraded may not be capable of being effectively managed.

H. EXISTING STATE NATURAL AREAS (SNA) DESIGNATIONS/NATURAL COMMUNITY TYPES LIMITED IN THE LANDSCAPE

There are no existing State Natural Areas on any of the properties, nor are there any identified examples of High Value Conservation Forests (HCVF).

Interim Forest Management Plan

Dodge & Jefferson Counties – Scattered Properties

I. PRIMARY PUBLIC USES (RECREATION)

Hunting, trapping, fishing, hiking, wildlife viewing, cross country skiing and bird watching are all uses that are allowed on all of the Dodge and Jefferson County properties.

J. BIOTIC INVENTORY STATUS

There is no Rapid Ecological Assessment or Biotic Inventory for the Dodge and Jefferson County properties listed on this plan.

K. DEFERRAL/CONSULTATION AREA DESIGNATIONS

There are no existing deferral or consultation area designations on any of the Dodge and Jefferson County properties listed on this plan.

Part 2: Future Management – IFMP components

FOREST MANAGEMENT OBJECTIVES *(Outline primary forest management objectives)*

With all forest management objectives, there are several more universal objectives that can be attained including options such as increasing large snags and coarse woody debris, controlling the spread of invasive non-native plant species and consideration for Wildlife Action Plan priorities and management of SGCNs.

The management objectives for these properties are generally the same throughout, with minor variations. For vegetative management, the forested areas also will be managed similarly on all properties, with consistent management objectives. Generally, the upland areas will be managed to promote oak with a lesser mix of central hardwoods (hickory, walnut and cherry).

In general the forest management objective for this area is to promote healthy, vigorous stands that are better able to withstand insect and disease attacks, and that offer good aesthetic values, wildlife habitat and quality forest products. Forest management practices should promote native forest types that enhance diverse wildlife populations and provide wildlife recreation opportunity.

The primary forest management objectives include the following:

1. Identification of viable forest acreage that is to be managed in a manner that will maintain that acreage in a productive forested cover type.
2. Identification of forested acreage that may potentially be converted to other cover types that could improve upon habitat that is otherwise fragmented or lacking from the property.
3. Maintain forest health and species diversity across the properties to the greatest extent possible.
4. Favor mast producing species such as oak and hickory where they exist.
5. Allow for regeneration of aspen in those areas where aspen is currently present and it does not negatively affect other habitat or cover types.
6. Prepare the property for emerald ash borer by reducing the proportion of ash in stands where it is present while also encouraging establishment of other appropriate, native species that are capable of growing in similar conditions.
7. Reduce the prevalence and dominance of invasive non-native species and control them to the extent possible with the knowledge and resources available.

Interim Forest Management Plan

Dodge & Jefferson Counties – Scattered Properties

PROPERTY PRESCRIPTIONS *(Identify specific and pertinent prescriptions by area or forest type, including passive management areas, extended rotation, and other information that will help achieve the objectives)*

ALL STANDS – The Wildlife Action Plan describes Priority Conservation Actions that make effective use of limited resources and address multiple species with each action. All proposed forestry prescriptions should consider applicable Priority Conservation Actions, Wildlife Action Plan priorities, property objectives and be based on individual stand level needs.

Forest management prescriptions are the same for all properties, and will follow the forest management principles outlined in the "Wisconsin Forest Management Guidelines" and the "Silviculture Handbook" for those stands where continuation of the forested habitat type is the goal. For those areas where forested acreage may be converted to other cover types those guidelines will not apply.

Pre-salvage harvests may be conducted in woodlands with significant ash component.
