

Wisconsin Conservation Congress Mississippi River Advisory Committee

Genoa National Fish Hatchery
S5689 State Road 35
Genoa, WI 54632
August 25, 2018 at 9:30 am

NOTICE IS HEREBY GIVEN that the Mississippi River Advisory Committee of the Wisconsin Conservation Congress will convene at 9:30 am on August 25, 2018 at the Genoa National Fish Hatchery S5689 State Road 35, Genoa, Wisconsin. The committee will review and act on the items listed on this agenda.

NOTICE IS FURTHER GIVEN that following the meeting, members of the Mississippi River Advisory Committee of the Wisconsin Conservation Congress will participate in a tour of the Genoa National Fish Hatchery facility.

ORDER OF BUSINESS

I. Organizational Matters

- A. Call to order
- B. Roll call
- C. Agenda approval or repair
- D. Review committee mission statement
- E. Public comments

*Citizens who wish to address the committee should contact the committee chair (**Michael Britton** at **715-234-0096**) prior to **August 23, 2018**.*

II. Information & Action Items

- A. Citizen resolutions - *none*
- B. Department information items & updates
 1. DNR updates
 2. Law enforcement update
- C. USFWS updates
- D. Update on public right to step across railroad right of way
- E. Ongoing river initiatives and projects---WDNR & USFWS

III. Member Matters

IV. Adjournment

Give Us Your Feedback:

Following your committee meeting, please take the time to complete the WCC Advisory Committee Evaluation Form and provide leadership with input and feedback on how well the committee functioned.

Visit <http://dnr.wi.gov/about/wcc/local.html> and click on Advisory Committee Evaluation Form under Delegate Resources.

Genoa is located 20 miles south of La Crosse, Wisconsin, on both sides of State Highway 35 (the Great River Road). It is roughly 35 miles north of Prairie du Chien, Wisconsin.

Committee Chair and Vice Chair:

Michael Britton (715) 234-0096

Marc Schultz (608) 792-1445

NOTE: Per the WCC Code of Procedures VII.J.3, committee members must notify the committee chair or vice-chair no less than 5 days prior to the scheduled meeting to confirm your attendance.

Establishment of the Hatchery

Genoa National Fish Hatchery was created by the Upper Mississippi River Wildlife and Fish Act of 1931. It is one of 69 federal hatcheries managed by the U.S. Fish & Wildlife Service. The location was selected because of its proximity to the Mississippi River and its reliable source of broodfish and artesian well water, both of which are used to raise fish and fill ponds. Hatchery construction was completed by Franklin Delano Roosevelt's Works Progress Administration during the Great Depression.

Each year, Genoa provides millions of eggs, fry and fingerlings of many different species to state fishery stations, federal hatcheries, National Wildlife Refuges, Department of Army installations and seven Native American Tribes to support ongoing fish management and restoration programs.

Genoa- An All-Purpose Hatchery!

Genoa's location and its ability to create different rearing environments and water temperatures, makes it one of the most diverse hatcheries in the nation. Nineteen ponds ranging in size from one-tenth of one acre to 33 acres, six raceways, and seven intensive rearing buildings make it capable of collecting, culturing, and rearing *cold*, *cool* and *warm water* fish species. *Genoa raises, holds and rears more species of fish (15) and freshwater mussels (15) than almost any other federal fish hatchery!*

Genoa's Mission-Meeting the Needs of Fishery Conservation

Genoa's mission has changed and evolved over the years. Initially its purpose was to raise bass and panfish for area waters. In the 1950s it evolved to sportfish restoration, predominantly northern pike and walleye. Today eggs and fry are still provided to state conservation agencies to assist them in their fishery management programs. But, as science developed and needs for fishery conservation in the country changed, so did the hatchery's mission.

In the 1990s, the value of hatcheries as important tools for recovering and restoring threatened and endangered fish and aquatic species was recognized and Genoa expanded its traditional missions to include recovering and restoring endangered mussels, lake sturgeon and coaster brook trout.

Today, Genoa's mission is to;

- recover threatened and endangered aquatic species,
- restore threatened fish populations,
- provide fishery resources support to National Wildlife Refuges, Native American tribes, and to
- provide sport fish to increase recreational opportunities on public lands.

Endangered Mussel Recovery

Genoa is home to the largest mussel culture recovery project in North America. The Higgins-Eye Pearly mussel (*Lampsilis higginsii*), has been listed under the Federal Endangered Species Act since 1976. The hatchery produces over 500,000 Higgins Eye mussel juveniles for stocking into four river systems in the Upper Mississippi River watershed. Genoa also propagates blue catfish, channel catfish and juvenile mussels for work related to the Winged Mapleleaf mussel recovery program. This very rare species of mussel is one of the most endangered freshwater mussels in North America.

Lake Sturgeon Restoration

Low lake sturgeon populations concern state and federal cooperators throughout the continental United States. Wisconsin and the international border waters in northern Minnesota and Michigan presently produce the only stable populations of these fish. Genoa has grown into one of the largest culture operations for restoration of this species in the United States. A sturgeon production building allows the station to raise over 30,000 eight-inch sturgeon per year to support five ongoing restoration programs. These sturgeon fingerlings are then stocked in Missouri, Minnesota and Wisconsin waters. Sturgeon eggs and fry are also shipped to other federal stations for stocking and research needs.

Coaster Brook Trout

Coasters are native brook trout that live a portion of their lives in the Great Lakes or in the ocean along the Atlantic coast of North America. They migrate up tributaries to spawn, where the young fry will grow in streams until they are about three to six inches long. Then they migrate back to the oceans or lakes to feed and grow. When mature, adult coasters return to their birth streams, usually in about three to five years.

Coasters differ from other types, or “strains,” of brook trout generally by the habitats they live in and the great size that they attain. Although 10-pound coasters have been documented, an average coaster weighs from one to four pounds.

The coaster strain of the brook trout (*Salvelinus fontinalis*) became a high priority for restoration during the past decade. Genoa has been involved with all aspects of the captive propagation of this species, including brood stock collection and creation of isolation facilities which allow wild fish eggs to be quarantined and tested for dangerous diseases before transfer to Service hatcheries. Genoa raises 50,000 coasters each year to support restoration programs in Michigan and Minnesota. The station serves as a backup facility to safeguard strains of coasters that have been collected on Isle Royale National Park.

Lake Trout Restoration

The U.S. Fish & Wildlife Service restores native fish species in the Great Lakes and has been involved in lake trout restoration since the 1950s, when fishery populations in the Great Lakes declined from overharvest, pollution, habitat destruction and the parasitic sea lamprey.

Genoa contributes to these restoration efforts by quarantining lake trout eggs and fish for 18 months until disease-free clearance is established. These strains are used to develop captive broodstocks to be used as an egg source to plant fish in the upper Great Lakes.

Work conducted on lake trout centers primarily on the isolation and quarantine of specific strains collected in the upper Great Lakes, or Finger Lakes Region of New York. Strains are selected based on restoration goals, post stocking survival and the strain's ability to avoid sea lamprey predation.

Recreational Fishing and Sport Fish Restoration

Genoa raises over 10 species of fish to contribute to sport fish restorations in tribal, federal and state waters. Species include walleye, northern pike, largemouth bass, smallmouth bass, brook trout, rainbow trout, yellow perch, sauger, black crappie and bluegill.

Genoa is one of the few federal hatcheries that still collect wild spawning fish in spring netting operations. During March and April, hatchery crews set between 40 and 50 hoop nets and fyke nets to collect ripe and spawning females and males. The nets are checked daily until spring spawning runs end in early May. The eggs are removed from ripe fish, called spawning, and the fish are released unharmed to the river. Then the eggs are taken back to the station to begin their rearing process. In an average year, 10-20 million eggs will be taken for ongoing management activities and stocking programs across the Midwest.

Public Use at Genoa

The office is open Monday-Friday, from 8:00 a.m. to 3:30 p.m.

Participant holds up catch at Kids' Fishing Day.
USFWS

Group tours are conducted throughout the year for local school and civic groups. These tours are available upon request. A favorite time of the year is springtime, during our river broodstock collection of northern pike and walleye. This runs from late-March through early May. The end of May through September is a good time to see our lake sturgeon program.

Hatchery Calendar of Events

- Largemouth bass and walleye culture for endangered mussel recovery
- Coaster brook trout fry and yearling production
- Rainbow trout yearling production

April-May

- Northern pike and walleye broodstock collection and egg take from river

May-June

- Lake sturgeon spawning and early fry rearing
- Endangered Higgins Eye mussel infestation and host fish distribution
- Kids' Fishing Day

July-August

- Lake sturgeon culture and pond management for warmwater fish

September-October

- Pond harvesting of walleye and bass fingerlings for stocking
- Lake sturgeon fingerling distribution to restoration sites
- Fathead minnow pond harvest and distribution
- Endangered Winged Mapleleaf mussel infestation and host fish culture

November-December

- Coaster brook trout spawning and egg arrival and care
- Lake trout eggs arrive for isolation program
- Rainbow trout egg and yearling culture

Fish Production Activities

Join our Friends Group!

You can tell from the photos that running a hatchery is a big operation. But it's also fun, interesting work and a chance to give back and support your local fishery. A Friends Group is:

- an advocate for local fish and wildlife populations and their continued health;
- a support group for local U.S. Fish and Wildlife Service fisheries offices and their mission;
- a formal, non-profit organization which supports the mission of local Mississippi fisheries stations of the Service;
- a private and independent organization formed and managed by local citizen leaders; and
- a grassroots organization formed by private citizens who support their local Service fisheries office.

Contact the office to learn how YOU can help the Genoa National Fish Hatchery !

Finding the Hatchery

Genoa is located 20 miles south of La Crosse, Wisconsin, on both sides of State Highway 35 (the Great River Road). It is roughly 35 miles north of Prairie du Chien, Wisconsin.
