Subject: Soil Excavation Documentation Report
Fire Technology Center and R&D Grounds – Fuel Distribution System Upgrade
Project
Tyco Safety Products, Ansul Incorporated
Marinette, Wisconsin
WDNR BRRTS No. 03-38-001345
WDNR FID No. 438005590

Dear Mr. Walden:

Earth Tech, Inc. (Earth Tech) is pleased to submit the enclosed Soil Excavation Documentation Report for the Tyco Safety Products, Ansul Incorporated, Fire Technology Center and R&D Grounds located at 2700 Industrial Parkway South, in Marinette, Wisconsin. This report is submitted in general accordance with the requirements of NR 724.15 "Documentation of Construction and Completion".

Please call me if you have any questions or need additional information.

Respectfully Submitted,

Earth Tech, Inc.

D. S. Henderson

David S. Henderson, P.E.
Senior Project Manager

EXECUTIVE SUMMARY

Earth Tech, Inc. was retained by Tyco Safety Products, Ansul Incorporated in May 2005 to perform a series of projects on the Fire Technology Center and Research and Development fuel distribution system including testing, demolition, and upgrade activities. The Fire Technology Center is located at 2700 Industrial Parkway South, Marinette Wisconsin. The Site has been identified by the Wisconsin Department of Natural Resources under the Bureau of Remediation and Redevelopment Tracking System (BRRTs) No. 03-38-001345.

Earth Tech prepared this report to present results from the excavation and disposal of petroleum impacted soil that occurred during the demolition and upgrade phases of the project. Earth Tech conducted these activities in accordance with Wisconsin Administrative Code Chapters NR 700 through NR 747 and Chapter NR 141. This report is submitted in general accordance with the requirements of NR 724.15 "Documentation of Construction and Completion".

The first phase of construction work for the project began in January 2006 with removal/abandonment in place of the existing fuel distribution piping and demolition of a select number of fire training structures including excavations of associated petroleum contaminated soils. Construction for the upgraded fuel distribution system, along with several new fire training pads and props, occurred during the summer and fall of 2006.

In total, 3,212.94 tons (approximately 4,820 cubic yards) of petroleum contaminated soil was excavated, transported to, and disposed of at the Waste Management landfill facility located in Menominee, Michigan. In addition, 106.07 tons of concrete that exhibited petroleum staining was transported to the landfill for disposal as construction and demolition debris.

Based on confirmation soil sampling analytical results, field instrumentation readings, and construction observations, residual petroleum contamination appears to exist in six general areas on the Fire Technology Center training field.

Groundwater is being monitored on a quarterly basis to document contaminant concentrations and to evaluate the effectiveness of natural attenuation as a final remedial action. Monitoring program results are submitted to the Wisconsin Department of Natural Resources.

1.0 INTRODUCTION

Earth Tech, Inc. (Earth Tech) was retained by Tyco Safety Products (TSP), Ansul Incorporated in May 2005 to perform a series of projects on the Fire Technology Center (FTC) and Research and Development (R&D) fuel distribution system including testing, demolition, and upgrade activities. The FTC is located at the 2700 Industrial Parkway South, Marinette Wisconsin (the Site). The Site has been identified by the Wisconsin Department of Natural Resources (WDNR) under the Bureau of Remediation and Redevelopment Tracking System (BRRTs) No. 03-38-001345.

Earth Tech prepared this report to present the results from the soil excavation and associated investigation activities that occurred during the demolition and upgrade phases of the project. Earth Tech conducted these excavation and investigation activities in accordance with Wisconsin rules and regulations in effect at the time of the work. Specifically, Wisconsin Administrative Code (WAC) Chapters NR 700 through NR 747 and Chapter NR 141.

This report is submitted in general accordance with the requirements of NR 724.15 "Documentation of Construction and Completion".

2.0 BACKGROUND INFORMATION

2.1 Site Description

The Site is located at 2700 Industrial Parkway South in the City of Marinette, Marinette County, Wisconsin. The public land survey description is the NE ¼ of the NE ¼ of Section 13, Township 30 North, Range 23 East. A Project Location map is presented on the Drawings Title Sheet and the general pre-demolition site features are presented on Figure C-1.

2.2 Regional Geology

The topography of the site is generally flat. The Soil Survey of Marinette County, Wisconsin identifies the soils at the FTC training field as Udorthents loam¹. Previous investigations have classified these soils by the Unified Soil Classification System (USCS) as poorly graded sand (SP) to silty sand (SM) from the ground surface to the depth of the investigated interval, approximately 33 feet below ground surface (bgs).

2.3 Regional Hydrogeology

Excavation occurred as part of the demolition excavation activities in January 2006, and groundwater was encountered at a depth of approximately 7 feet bgs. Historical groundwater elevation data² suggests that the depth to groundwater at the site varies seasonally across the site. Regional groundwater flow appears to be east and northeast, towards the Bay of Green Bay.

"<http://soils.usda.gov/technical/classification/osd/index.html>"

² Results of February, May, and August 2005 Groundwater Monitoring Report, STS Consultants, LTD., November 1, 2005.

2.4 Site History

The FTC is a fire suppressant training, testing, research, and development facility initially built in the early 1960s. Activities generally occur in two areas at the facility, the Fire School area and the Research and Development (R&D) area.

In 1992 a 550-gallon gasoline underground storage tank was removed at the FTC grounds and identified on WDNR/WDCOM records as "abandoned by removal". Evidence of a release was identified at that time and a Notice of Release was filed with the WDNR (BRRTs No. 03-38-001345). Dames & Moore (subsequently named URS Corporation) was retained to conduct an assessment of the impact. URS Corporation continued site investigation activities until 2002 when STS Consultants of Green Bay, Wisconsin, was retained. In January 2006 Earth Tech of Sheboygan, Wisconsin was retained to continue the long-term groundwater monitoring.

The Fire Training School and R&D facilities use two 12,000-gallon aboveground storage tanks (ASTs) containing heptane, with their associated underground distribution piping, as a fuel source for training and testing. In May 2005, Earth Tech conducted tightness and cathodic protection testing of the underground lines associated with the AST fuel distribution piping. Four piping runs were tightness tested and one piping run was tested for cathodic protection. Three piping runs that serviced the Fire Training School did not pass tightness testing (and therefore cathodic protection testing was unnecessary). These lines were purged of fuel and immediately removed from service (abandoned in place) by capping and disconnection from the AST. The fourth pipe run, which serviced the R&D portion of the facility, passed its tightness test but did not pass the cathodic protection test.

On May 27, 2005, Earth Tech verbally notified Mr. James Walden, WDNR Project Manager, of the potential release associated with the Fire School fuel distribution piping. Mr. Walden indicated that a new, formal release report would be unnecessary for the piping and that he would record the "new" release in the existing file.

Removing the Fire Training School pipelines from service (capping them in-place) effectively shut down the school. Subsequently, Earth Tech designed and installed a Wisconsin Department of Commerce (WDCOM) approved temporary fuel distribution system that allowed the Fire School to operate for the 2005 training season. During the summer and fall of 2005 Earth Tech worked with TSP personnel to design an upgraded permanent fuel distribution system for both the Fire Training School and R&D facilities.

On December 13, 2005, Earth Tech provided the WDNR with a copy of the Bid Documents for Demolition Activities as a Work Plan in general accordance with the requirements of NR 724.06 "Design Report" and NR 724.11 "Design Plan and Specifications". The Work Plan scope of work was for possible remedial excavation activities scheduled to occur during demolition.

The first phase of work for the fuel distribution system upgrade project began in January 2006 with the removal/in-place abandonment of the existing fuel distribution piping, associated excavation activities, and the demolition of a select number of fire training pans and props. Construction of the upgraded fuel distribution system, along with several new fire training pans and props, occurred during the summer and fall of 2006. The focus of this report is the excavation and proper disposal of petroleum-impacted soil conducted in conjunction with the demolition and upgrade of the fuel distribution system. This report is submitted in general

accordance with the requirements of NR 724.15 "Documentation of Construction and Completion".

3.0 SERVICES

3.1 Scope of Work

Earth Tech evaluated soils excavated during demolition and upgrade activities to ensure proper handling of petroleum impacted soils, and to evaluate contaminated soils left in place. In general, this included the following activities:

- Pre-demolition meetings with Earth Tech's excavation contractor, SGS Environmental Services, to discuss excavation procedures and the handling of excavated petroleum-contaminated soils during demolition activities.
- Pre-system upgrade meetings with Earth Tech's system upgrade contractor, Martell Construction, to discuss excavation procedures and the handling and disposal of excavated petroleum-contaminated soils during upgrade activities.
- Documenting abandonment of one groundwater monitoring well removed during excavation activities.
- Documentation of soil excavation, transportation, and disposal activities.
- Evaluation of soil field screening and analytical results from excavation activities.

3.2 Project Team

The parties involved in this project include:

Property Owner:

Green Bay, WI 54302
Telephone: (920) 469-2436

4.0 EXCAVATION AND INVESTIGATION PROCEDURES

Site-specific excavation procedures are described below. Earth Tech's standard field methodologies for excavation and surface soil sampling are presented in Appendix A.

4.1 Soil

4.1.1 Soil Field Screening Methods

Soil samples obtained from excavations were immediately split into field and laboratory samples. Soil samples were field screened with a photoionization detector (PID) to assist in determining the lateral extent and depth of excavation activities.

Earth Tech personnel screened the field samples for Volatile Organic Compounds (VOC's) with a calibrated PID (Mini-Rae Model 2000, 10.6 eV lamp) using the headspace method. Results were reported as instrument units (IUs). The results of the field screening were used to determine which soil samples to submit for laboratory analysis.

In general, excavated soils that exhibited PID readings greater than 10 IUs were considered contaminated. Excavated soils exhibiting PID readings greater than 10 IUs were either temporarily stockpiled on site for off-site disposal or loaded into trucks and transported to the landfill.

4.1.2 Soil Excavation Methods

Excavation of petroleum contaminated soils was conducted in conjunction with both demolition and upgrade activities.

Demolition Activities:

Demolition was focused on removal of existing unusable fuel lines, demolition of several fire training pans/pads, and the limited excavation of petroleum contaminated soils.

The existing unusable fuel lines were removed or abandoned in-place in accordance with WDCOM Com 10 regulations including purging of the pipelines and soil sampling along the piping trench runs. Throughout demolition activities Mr. Randy Barnes, WDCOM Local Program Officer, conducted inspections to verify the proper removal/abandonment of the piping runs.

Several concrete fire training pans or pads were demolished to facilitate future construction. Demolition included excavation of associated petroleum-contaminated soils, where identified. The structural demolition work was accomplished with the use of a skid-steer mounted concrete breaker.

The limited excavation of petroleum contaminated soils was accomplished using a backhoe, front-end loader, and skid-steer for excavation, stockpiling and/or placement of the excavated soil into trucks. The excavations were backfilled using clean soils excavated during demolition as well as imported clean sand fill.

Upgrade Activities:

The fuel distribution system upgrade included installing new underground fuel lines and electrical conduits, the construction of new fire training pans and pads, and the construction of additional support structures (i.e. loading dock, unloading area). During upgrade activities, petroleum-contaminated soil excavation was limited to the removal of soil directly associated with the new construction.

During both demolition and upgrade activities, petroleum-contaminated soils were temporarily stockpiled on and covered with plastic prior to transport to the landfill. Excavated contaminated soils were transported to the Waste Management landfill facility located in Menominee, Michigan.

4.1.3 Soil Laboratory Analysis Methods

During demolition activities, confirmation soil samples were collected from both the base and sidewalls of the excavations and/or trenches. Samples were submitted to a State of Wisconsin Certified laboratory for analyses of the following parameters: Volatile Organic Compounds (VOCs) plus n-heptane, EPA Method SW 846 8260B, and Polycyclic Aromatic Hydrocarbons (PAHs), EPA Method SW 8270C-SIM.

Confirmation soil samples were not collected for laboratory analysis during system upgrade activities because new construction generally occurred in areas previously sampled.

4.2 Groundwater

4.2.1 Monitoring Well Abandonment

Monitoring well FTC-28 was abandoned by SGS Environmental Services on January 23, 2006 during demolition activities in the area of Pan 1000. The abandonment was conducted in

accordance with NR 141 requirements and the WDNR Well/Drillhole/Borehole Abandonment form (WDNR Form 3300-5) is included in Appendix B. The location of FTC-28 is illustrated on Figure C-1 (attached).

5.0 EXCAVATION AND TESTING RESULTS

Earth Tech evaluated soil field screening and laboratory analytical data to determine which soils were to be excavated and disposed of at the landfill and which soils could remain in-place.

5.1 Soil Results

5.1.1 Field Screening Results

Field instrument (PID) readings are not regulated by the WDNR, but are considered an indication of possible VOC contamination. Earth Tech used PID readings to help determine the extent of possible contamination and reduce the number of laboratory samples.

Demolition Activities:

SGS Environmental Services began excavation activities associated with demolition on January 10, 2006 and continued through February 6, 2006. Excavations included shallow trenching (0 to 2 feet bgs) where piping runs were removed and larger, deeper excavations (0 to 7 feet bgs), in areas where structures were demolished and petroleum-contaminated soils were present and accessible. PID readings ranging between <10 and 1,700 instrument units (IUs) were encountered during demolition activities.

Areas where shallow trenching for piping removal was conducted, along with the dates of removal, are illustrated on Figure C-2. Limited excavation required for demolition activities and contaminated soil removal was conducted in four separate areas (designated Area 1 through Area 4). These four excavation areas are illustrated on Figure C-3. PID field screening results are presented on Figure C-4.

Backfill was placed in lifts and compacted, where appropriate. Plastic was placed in the Area 4 excavation prior to backfilling to separate remaining petroleum-contaminated soils left in place and clean backfill soils. Final backfilling associated with demolition activities was completed on February 8, 2006.

Upgrade Activities:

Martell Construction, the general contractor for the fuel distribution system upgrade, began construction activities in June 2006 and continued through the fall of 2006. Excavation activities associated with the upgrade work were completed by the end of August 2006.

The excavations for system upgrades included shallow trenches for new fuel piping runs, pan drainage lines, and electrical conduit runs. Larger excavations were completed during construction of new fire training pans and pads, installation of a new oil/water separator (OWS) system, and a new loading dock.

Soils encountered during system upgrade activities exhibited PID readings between <10 to 1,350 IUs. Elevated PID field screening results were encountered in excavations near the

rebuilt 1,000 Pan, near the AST heptane storage area, near New Hose Reel #1 and HV-7 (heptane valve), near the Impinging prop, HV-8, Broken Flange prop, HV-4, Truck Pan 450, and southeast of the new OWS. Contaminated soil excavated areas associated with the upgrade activities along with PID field screening results are illustrated on Figure C-7.

Petroleum-contaminated soils were transported to the Waste Management landfill facility located in Menominee, Michigan on January 18, 19, and 23, 2006 during demolition activities and June 28, 29, and 30, and August 15, 16, and 17, 2006, during system upgrade activities. A total of 3,212.94 tons (approximately 4,820 cubic yards) of petroleum-contaminated soils were transported to the landfill. Concrete that exhibited petroleum staining was transported to the landfill for disposal as construction and demolition debris. A total of 106.07 tons of concrete was transported to the Waste Management, Menominee Landfill for disposal. A summary of landfill disposal tickets along with copies of the tickets is presented in Appendix C.

5.1.2 Laboratory Analysis Results

Twenty-eight confirmation soil samples were analyzed for VOC's plus n-heptane and PAHs during demolition activities. Laboratory analytical results were compared to WDNR generic soil residual contaminant levels (RCLs) standards as listed in Wisconsin Administrative Code NR 720.09 for the protection of groundwater, Environmental Protection Agency (EPA) soil screening levels (SSL) standards for protection of groundwater and direct contact per NR 720.19, and PAH interim generic RCL standards for protection of groundwater and direct contact.

According to the City of Marinette Zoning Administrator³ the FTC property at 2700 Industrial Parkway South is zoned Heavy Industrial (I1). Therefore, soil analytical results were compared to applicable industrial direct contact health assessment standards.

In general, excavation confirmation soil samples were obtained from the following areas:

- Piping trench samples designated CS-1 through CS-11,
- Area 1 excavation samples (S-1 through S-3),
- Area 2 excavation samples (S-1 through S-8),
- Area 3 excavation samples (S-1 through S-4), and
- Area 4 excavation samples (S-1 and S-2).

Soil analytical results are summarized in Table 1. Figure C-5 illustrates the confirmation soil sampling locations.

VOC's Discussion: VOCs were detected in 17 of the 28 samples submitted for laboratory analysis. A total of 13 different VOCs were detected in the 17 soil samples that exhibited VOC concentrations. Only six of the thirteen VOCs detected exhibited concentrations at concentrations greater than established or calculated standards.

- 1,2,4-Trimethylbenzene (TMB) was detected at a concentration greater than the NR 720.19 EPA SSL Industrial Direct Contact standard in the sample collected from CS-3.
- 1,3,5-TMB was detected at a concentrations greater than the NR 720.19 EPA SSL Industrial Direct Contact standard in the sample collected from CS-3.

³ City of Marinette, Zoning Administrator, personal communication, February 28, 2007.

- Benzene was detected at concentrations greater than the NR 720.09 Groundwater Protection standard in the samples collected from CS-2, CS-3, CS-10, Area 3:S-1, and Area 4:S-1 and the NR 720.19 EPA SSL Industrial Direct Contact standard in the samples collected from CS-3, and CS-10.
- Ethylbenzene was detected at concentrations greater than the NR 720.09 Groundwater Protection standard in the samples collected from CS- 1, CS-3, CS-4, CS-10, CS-11, Area 4:S-1, and Area 4:S-2 and the NR 720.19 EPA SSL Industrial Direct Contact standard in the samples collected from CS-3, and CS-10.
- Toluene was detected at concentrations greater than the NR 720.09 Groundwater Protection standard in the samples collected from CS-1, CS-2, CS-3, CS-4, CS-9, CS-10, CS-11, Area 4:S-1, and Area 4:S-2.
- Total xylenes were detected at concentrations greater than NR 720.09 Groundwater Protection standard in the samples collected from CS-1, CS-2, CS-3, CS-4, CS-9, CS-10, CS-11, Area 4:S-1, and Area 4:S-2 and the NR 720.19 EPA SSL Industrial Direct Contact standard in the samples collected from CS-3.
- Other VOCs detected were at concentrations less than standards or standards do not currently exist.

Although n-Heptane was detected in 15 of the 28 soil samples submitted for analysis, no regulatory standards, either WDNR or EPA SSLs, currently exist for heptane.

PAH's Discussion: PAHs were detected in 16 of the 28 samples submitted for laboratory analysis. Eighteen different PAHs were detected in the 16 soil samples that exhibited PAH concentrations. Five of the eighteen PAHs detected exhibited concentrations greater than standards.

- 1-Methylnaphthalene was detected at concentrations greater than NR Interim PAH Generic RCL's for Groundwater Protection standard in the samples collected from Area 4:S-1 and Area 4:S-2.
- 2-Methylnaphthalene was detected at concentrations greater than NR Interim PAH Generic RCL's for Groundwater Protection standard in the samples collected from Area 4:S-1 and Area 4:S-2.
- Acenaphthylene was also detected at concentrations greater than NR Interim PAH Generic RCL's for Groundwater Protection standard in the samples collected from Area 4:S-1 and Area 4:S-2.
- Naphthalene was detected at concentrations greater than NR Interim PAH Generic RCL's for Groundwater Protection standard in the samples collected from CS-1, CS-2, CS-3, CS-4, CS-9, CS-10, CS-11, Area 4:S-1, and Area 4:S-2.
- Phenanthrene was detected at concentrations greater than NR Interim PAH Generic RCL's for Groundwater Protection standard in the samples collected from CS-1, Area 4:S-1, and Area 4:S-2.

Figures C-5 and C-6 presents the VOC and PAH analytical results, respectively, and their sample locations. Laboratory reports are included in Appendix D.

5.1.3 Estimated Extent of Residual Contamination

Based on the results of the demolition and upgrade activities, residual petroleum contamination appears to exist in six general areas on the FTC grounds. The extent of these areas (See Figure 8) was estimated using confirmation soil sampling analytical results, PID readings greater than 10 IUs, and visual observations.

6.0 EXCAVATION SUMMARY

The following is a summary of the geologic, hydrogeologic, field observations, and analytical data obtained during Earth Tech's excavation and upgrade/remediation activities at the Site.

- The lithology beneath the site generally consists of poorly graded sand to silty sand from the ground surface to the depth of the investigated interval.
- Groundwater elevation data indicates that depth to groundwater varies seasonally across the site. Groundwater has been interpreted to flow in an easterly or northeasterly direction.
- Monitoring well FTC-28 was abandoned during excavation activities in January 2006.
- The excavation and proper disposal of 3,212.94 tons (approximately 4,820 cubic yards) of petroleum contaminated soil was transported to the Waste Management, Menominee Landfill for disposal.
- The demolition and proper disposal of a total of 106.07 tons of petroleum stained concrete was transported to the Waste Management, Menominee Landfill for disposal as construction and demolition debris.
- Groundwater is being monitored on a quarterly basis to document contaminant concentrations and to evaluate the effectiveness of natural attenuation as a final remedial action. Monitoring program results are submitted to the WDNR.

APPENDIX A

Earth Tech's Standard Field Methodologies

**STANDARD OPERATING PROCEDURE
FOR
EXCAVATION AND SURFACE SOIL SAMPLING**

1.0 PURPOSE

The purpose of this Standard Operating Procedure (SOP) is to describe the method for sampling surface soils at grade or from excavations. Typically, these excavations would be associated with the removal of above or underground storage tanks, piping, transfer stations, pump facilities, valve pits, sumps, etc. Soil samples are collected over an aerial distribution to characterize the surface conditions and used to verify that the area of concern is free of contamination or to define the extent of contamination. This procedure describes equipment and field methods necessary to collect surface and excavation soil samples.

2.0 REQUIREMENTS

Sample collection information should be recorded in the field log book or the Soils Data form provided in Appendix E of the QAPP. Soil sampling locations, intervals and chemical parameters are discussed in the site-specific Work Plan. All soil samples will be visually classified in the field using the Unified Soil Classification System (USCS) pursuant to ASTM D-2488, Standard Practice for Description and Identification of Soils (Visual-Manual Procedure).

Sample forms will be prepared in the field, as samples are taken, by a qualified, experienced geologist. Each form will be signed by the preparer. All log book and form entries should be printed in ink and photo reproductions should be clear and legible. Illegible or incomplete forms will not be accepted.

The sampling locations must be clearly marked on a site map or location sketch and staked in the field using suitable markers (e.g., wire flags or lath). The accuracy of the soil sampling locations will be identified in the site-specific Work Plan. Location sketches, referenced by measured distances from prominent surface features or known coordinates, will be shown on or attached to the form. Map scale should be indicated on a scaled drawing or sketch must contain all dimensions of excavations, sampling locations and reference surface features as would be required for a scaled CADD drawing. Each and every material type encountered will be described.

Unconsolidated materials should be described as outlined below and in the following sequence:

1. Descriptive USCS classification in accordance with ASTM D 2488-90.
2. Consistency of cohesive materials or density of non-cohesive materials.
3. Moisture content assessment (e.g., moist, wet, saturated).
4. Color.
5. Other descriptive feature (bedding, characteristics, organic materials, macrostructure of fine-grained soils such as root holes, fractures, etc.).
6. Depositional type (such as alluvium, till, loess).

Any special sampling problems should be recorded on the field forms or in the field log book, including descriptions of problem resolutions. Forms should include all other information relevant to a particular investigation, including but not limited to:

1. Odors.
2. Measurements with a photoionization detector (PID) or other field screening or testing results.
3. Any observed evidence of contamination in samples or excavations or evidence of leaking pipes, tanks, etc.

3.0 RESPONSIBILITIES

The Site Geologist performs or directly supervises the sampling procedure and classifies soil samples. The Site Geologist is also responsible for the measurements, observations, and the decontamination of sampling equipment. He/she must record all pertinent information on the appropriate form(s) and in the field log book.

The Field Team Leader directs the packing and sealing of samples as described in SOP F-8.

4.0 EQUIPMENT

The following pieces of equipment may be needed to collect samples:

1. Stainless steel spatula, spoon or other sampler.
2. Stainless steel bowl.
3. Appropriate sampling containers.
4. Deionized or distilled water.
5. Decontamination supplies as specified in the project-specific work plan.
6. Steel retractable engineer's measuring tape (calibrated to 0.01 foot).
7. Organic vapor monitoring device (photoionization detector (PID) or similar instrument).
8. Appropriate health and safety equipment.
9. Soil Data Form
10. Field log book.

5.0 PROCEDURE

Before soil sampling begins, complete all general information on the field forms or the field log book in ink such as the site name, project number and equipment operator. Inventory the sample jars to be certain that a sufficient number of sample jars of the correct size and type are available to complete the sampling.

Equipment for shallow (approximately 0-1 foot) soil samples includes, but is not limited to, hand augers, hand trowels, shovels, spoons, sampling tubes, bowls, aluminum foil, and sampling slide hammers. This equipment must be stainless steel. Equipment must be decontaminated in accordance with SOP F-6 prior to use and between sample locations.

There are two sampling techniques generally used for surface sampling: the grab sample and the composite sample. A common way to select samples or do field screening is to perform a head space analysis. If the excavation is too deep to enter, sampling from a backhoe bucket may be necessary. These aspects of surface sampling are discussed below.

Grab sample A grab sample is collected at a specific location to represent soil conditions at a single point. It is not combined with soil from any other location. The soil will be taken from the sample location and placed and mixed in a clean stainless steel mixing bowl for placement in a sampling jar as described below.

Composite sample A composite sample represents the soil conditions over an area. Several sub-samples are collected from multiple locations in an area, mixed together and the mixture is then sampled. The procedure for composite soil sampling is as follows: upon each retrieval of the sampling device, the contents in the sampler shall be placed in a clean stainless steel mixing bowl keeping the bowl covered with aluminum foil between subsamples. After all sub-samples are collected in the bowl, the soil is stirred with a clean stainless steel spoon into a homogeneous mixture.

For both grab and composite samples, the soil mixture in the mixing bowl should be sectioned into four equal quadrants and placed into the appropriate sample jar(s) by taking small amounts from each successive quadrant until the sample jar is filled.

Samples for volatile organic compounds (VOCs) analysis should not be mixed in a bowl but should be taken directly from the sampling device. The soil sample will be collected using a coring device (e.g., cut syringe, EnCore™, or US Analytical's Easy Draw Syringe™ Sampler). The soil core (approximately 25g of soil) will be placed directly into a preweighed laboratory container and preserved with approximately 25 ml of methanol. Prior to collecting samples for analysis, a sample of similar material will be weighed to establish the correct volume of soil. Alternately, samples can be collected directly into a coring device and sealed using laboratory supplied containers. The VOC sample must be collected immediately upon retrieval of the sampling device and before any other samples are removed.

If head space analysis of the sample is required, the head space sample should be taken immediately upon retrieval and opening of the sampling device -- do not composite. If a VOC sample and a headspace sample are required, the VOC sample is taken first and the headspace

sample second in quick succession. For the headspace analysis, a representative sample, approximately 2 to 4 ounces, shall be placed in a glass jar. The jar shall be covered with at least one continuous sheet of aluminum foil and immediately secured with the jar lid. To minimize the number of jars used and the amount of contaminated waste generated, the jar may first be lined with a new clean sandwich bag inserted into the jar and draped over the edges. The jar shall be shaken for at least 15 seconds and allowed a minimum of 10 minutes to adequately volatilize. During cold weather, the sample will be warmed to room temperature prior to taking a head space measurement. If sandwich bags are used, new clean bags must be tested with a PID to verify that VOCs related to the bag's manufacturing are not present.

After the waiting period, the probe of the PID shall quickly be inserted into the bag, taking care not to push it into the sample, and the maximum meter response within 2 to 5 seconds shall be recorded as the head space analysis. The remainder of the sample in the sampling device shall be collected as described above.

Excavations may not be safe to enter as defined by OSHA regulations. These are deep and/or steep sided excavations which typically result from the removal of a underground storage tank (UST) or the excavation of deep contamination. In these situations, a backhoe can also be used to collect soil samples. The backhoe bucket must be free of soil from previous locations before the sample is taken. Once the sample is obtained and brought up to an area at grade and away from the edge of the excavation, the soil sample is collected from the backhoe bucket after the bucket has been placed on the ground and the backhoe operator signals for the sample to be taken. The sample should then be taken from the central portion of the bucket taking care to ensure that the sample soil has not contacted the sides of the bucket. The Health and Safety Plans and OSHA regulations shall be followed when working near open trenches and backhoes.

After a sample is collected it shall be labeled, preserved, stored, and shipped in compliance with SOP F-8.

All soil results are reported on a dry weight basis unless otherwise noted.

Qualifier Codes

Flag	Applies To	Explanation
A	Inorganic	Analyte is detected in the method blank. Method blank criteria is evaluated to the laboratory method detection limit. Additionally, method blank acceptance may be based on project specific criteria or determined from analyte concentrations in the sample and are evaluated on a sample by sample basis.
B	Inorganic	The analyte has been detected between the method detection limit and the reporting limit.
B	Organic	Analyte is present in the method blank. Method blank criteria is evaluated to the laboratory method detection limit. Additionally, method blank acceptance may be based on project specific criteria or determined from analyte concentrations in the sample and are evaluated on a sample by sample basis.
C	All	Elevated detection limit.
D	All	Analyte value from diluted analysis or surrogate result not applicable due to sample dilution.
E	Inorganic	Estimated concentration due to matrix interferences. During the metals analysis the serial dilution failed to meet the established control limits of 0-10%. The sample concentration is greater than 50 times the IDL for analysis done on the ICP or 100 times the IDL for analysis done on the ICP-MS. The result was flagged with the E qualifier to indicate that a physical interference was observed.
E	Organic	Analyte concentration exceeds calibration range.
F	Inorganic	Due to potential interferences for this analysis by Inductively Coupled Plasma techniques (SW-846 Method 6010), this analyte has been confirmed by and reported from an alternate method.
F	Organic	Surrogate results outside control criteria.
G	All	The result is estimated because the concentration is less than the lowest calibration standard concentration utilized in the initial calibration. The method detection limit is less than the reporting limit specified for this project.
H	All	Preservation, extraction or analysis performed past holding time.
HF	Inorganic	This test is considered a field parameter, and the recommended holding time is 15 minutes from collection. The analysis was performed in the laboratory beyond the recommended holding time.
J	All	Concentration detected equal to or greater than the method detection limit but less than the reporting limit.
K	Inorganic	Sample received unpreserved. Sample was either preserved at the time of receipt or at the time of sample preparation.
K	Organic	Detection limit may be elevated due to the presence of an unrequested analyte.
L	All	Elevated detection limit due to low sample volume.
M	Organic	Sample pH was greater than 2
N	All	Spiked sample recovery not within control limits.
O	Organic	Sample received overweight.
P	Organic	The relative percent difference between the two columns for detected concentrations was greater than 40%.
Q	All	The analyte has been detected between the limit of detection (LOD) and limit of quantitation (LOQ). The results are qualified due to the uncertainty of analyte concentrations within this range.
S	Organic	The relative percent difference between quantitation and confirmation columns exceeds internal quality control criteria. Because the result is unconfirmed, it has been reported as a non-detect with an elevated detection limit.
U	All	The analyte was not detected at or above the reporting limit.
V	All	Sample received with headspace.
W	All	A second aliquot of sample was analyzed from a container with headspace.
X	All	See Sample Narrative.
Z	Organics	This compound was separated in the check standard but it did not meet the resolution criteria as set forth in SW846.
&	All	Laboratory Control Spike recovery not within control limits.
*	All	Precision not within control limits.
+	Inorganic	The sample result is greater than four times the spike level: therefore, the percent recovery is not evaluated.
<	All	The analyte was not detected at or above the reporting limit.
1	Inorganic	Dissolved analyte or filtered analyte greater than total analyte; analyses passed QC based on precision criteria.
2	Inorganic	Dissolved analyte or filtered analyte greater than total analyte; analyses failed QC based on precision criteria.
3	Inorganic	BOD result is estimated due to the BOD blank exceeding the allowable oxygen depletion.
4	Inorganic	BOD duplicate precision not within control limits. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
5	Inorganic	BOD result is estimated due to insufficient oxygen depletion. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
6	Inorganic	BOD laboratory control sample not within control limits. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
7	Inorganic	BOD result is estimated due to complete oxygen depletion. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.

All soil results are reported on a dry weight basis unless otherwise noted.

Qualifier Codes

Flag	Applies To	Explanation
A	Inorganic	Analyte is detected in the method blank. Method blank criteria is evaluated to the laboratory method detection limit. Additionally, method blank acceptance may be based on project specific criteria or determined from analyte concentrations in the sample and are evaluated on a sample by sample basis.
B	Inorganic	The analyte has been detected between the method detection limit and the reporting limit.
B	Organic	Analyte is present in the method blank. Method blank criteria is evaluated to the laboratory method detection limit. Additionally, method blank acceptance may be based on project specific criteria or determined from analyte concentrations in the sample and are evaluated on a sample by sample basis.
C	All	Elevated detection limit.
D	All	Analyte value from diluted analysis or surrogate result not applicable due to sample dilution.
E	Inorganic	Estimated concentration due to matrix interferences. During the metals analysis the serial dilution failed to meet the established control limits of 0-10%. The sample concentration is greater than 50 times the IDL for analysis done on the ICP or 100 times the IDL for analysis done on the ICP-MS. The result was flagged with the E qualifier to indicate that a physical interference was observed.
E	Organic	Analyte concentration exceeds calibration range.
F	Inorganic	Due to potential interferences for this analysis by Inductively Coupled Plasma techniques (SW-846 Method 6010), this analyte has been confirmed by and reported from an alternate method.
F	Organic	Surrogate results outside control criteria.
G	All	The result is estimated because the concentration is less than the lowest calibration standard concentration utilized in the initial calibration. The method detection limit is less than the reporting limit specified for this project.
H	All	Preservation, extraction or analysis performed past holding time.
HF	Inorganic	This test is considered a field parameter, and the recommended holding time is 15 minutes from collection. The analysis was performed in the laboratory beyond the recommended holding time.
J	All	Concentration detected equal to or greater than the method detection limit but less than the reporting limit.
K	Inorganic	Sample received unpreserved. Sample was either preserved at the time of receipt or at the time of sample preparation.
K	Organic	Detection limit may be elevated due to the presence of an unrequested analyte.
L	All	Elevated detection limit due to low sample volume.
M	Organic	Sample pH was greater than 2
N	All	Spiked sample recovery not within control limits.
O	Organic	Sample received overweight.
P	Organic	The relative percent difference between the two columns for detected concentrations was greater than 40%.
Q	All	The analyte has been detected between the limit of detection (LOD) and limit of quantitation (LOQ). The results are qualified due to the uncertainty of analyte concentrations within this range.
S	Organic	The relative percent difference between quantitation and confirmation columns exceeds internal quality control criteria. Because the result is unconfirmed, it has been reported as a non-detect with an elevated detection limit.
U	All	The analyte was not detected at or above the reporting limit.
V	All	Sample received with headspace.
W	All	A second aliquot of sample was analyzed from a container with headspace.
X	All	See Sample Narrative.
Z	Organics	This compound was separated in the check standard but it did not meet the resolution criteria as set forth in SW846.
&	All	Laboratory Control Spike recovery not within control limits.
*	All	Precision not within control limits.
+	Inorganic	The sample result is greater than four times the spike level: therefore, the percent recovery is not evaluated.
<	All	The analyte was not detected at or above the reporting limit.
1	Inorganic	Dissolved analyte or filtered analyte greater than total analyte; analyses passed QC based on precision criteria.
2	Inorganic	Dissolved analyte or filtered analyte greater than total analyte; analyses failed QC based on precision criteria.
3	Inorganic	BOD result is estimated due to the BOD blank exceeding the allowable oxygen depletion.
4	Inorganic	BOD duplicate precision not within control limits. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
5	Inorganic	BOD result is estimated due to insufficient oxygen depletion. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
6	Inorganic	BOD laboratory control sample not within control limits. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
7	Inorganic	BOD result is estimated due to complete oxygen depletion. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.

Lab Number	TestGroupID	Field ID	Comment
868279-001	SPECVOA-S-ME	CS-1 2' BGS	F - Surrogate was above control criteria. This was confirmed by a second analysis on 01/19/2006.
868279-003	SPECVOA-S-ME	CS-3 2' BGS	F - Surrogate was below control criteria. This was confirmed by a second analysis on 01/20/2006.
868279-006	PAH+-S	CS-6 3' BGS	b - Analyte present in blank at 3.77 ug/Kg.

Qualifier Codes

Flag	Applies To	Explanation
A	Inorganic	Analyte is detected in the method blank. Method blank criteria is evaluated to the laboratory method detection limit. Additionally, method blank acceptance may be based on project specific criteria or determined from analyte concentrations in the sample and are evaluated on a sample by sample basis.
B	Inorganic	The analyte has been detected between the method detection limit and the reporting limit.
B	Organic	Analyte is present in the method blank. Method blank criteria is evaluated to the laboratory method detection limit. Additionally, method blank acceptance may be based on project specific criteria or determined from analyte concentrations in the sample and are evaluated on a sample by sample basis.
C	All	Elevated detection limit.
D	All	Analyte value from diluted analysis or surrogate result not applicable due to sample dilution.
E	Inorganic	Estimated concentration due to matrix interferences. During the metals analysis the serial dilution failed to meet the established control limits of 0-10%. The sample concentration is greater than 50 times the IDL for analysis done on the ICP or 100 times the IDL for analysis done on the ICP-MS. The result was flagged with the E qualifier to indicate that a physical interference was observed.
E	Organic	Analyte concentration exceeds calibration range.
F	Inorganic	Due to potential interferences for this analysis by Inductively Coupled Plasma techniques (SW-846 Method 6010), this analyte has been confirmed by and reported from an alternate method.
F	Organic	Surrogate results outside control criteria.
G	All	The result is estimated because the concentration is less than the lowest calibration standard concentration utilized in the initial calibration. The method detection limit is less than the reporting limit specified for this project.
H	All	Preservation, extraction or analysis performed past holding time.
HF	Inorganic	This test is considered a field parameter, and the recommended holding time is 15 minutes from collection. The analysis was performed in the laboratory beyond the recommended holding time.
J	All	Concentration detected equal to or greater than the method detection limit but less than the reporting limit.
K	Inorganic	Sample received unpreserved. Sample was either preserved at the time of receipt or at the time of sample preparation.
K	Organic	Detection limit may be elevated due to the presence of an unrequested analyte.
L	All	Elevated detection limit due to low sample volume.
M	Organic	Sample pH was greater than 2
N	All	Spiked sample recovery not within control limits.
O	Organic	Sample received overweight.
P	Organic	The relative percent difference between the two columns for detected concentrations was greater than 40%.
Q	All	The analyte has been detected between the limit of detection (LOD) and limit of quantitation (LOQ). The results are qualified due to the uncertainty of analyte concentrations within this range.
S	Organic	The relative percent difference between quantitation and confirmation columns exceeds internal quality control criteria. Because the result is unconfirmed, it has been reported as a non-detect with an elevated detection limit.
U	All	The analyte was not detected at or above the reporting limit.
V	All	Sample received with headspace.
W	All	A second aliquot of sample was analyzed from a container with headspace.
X	All	See Sample Narrative.
Z	Organics	This compound was separated in the check standard but it did not meet the resolution criteria as set forth in SW846.
&	All	Laboratory Control Spike recovery not within control limits.
*	All	Precision not within control limits.
+	Inorganic	The sample result is greater than four times the spike level; therefore, the percent recovery is not evaluated.
<	All	The analyte was not detected at or above the reporting limit.
1	Inorganic	Dissolved analyte or filtered analyte greater than total analyte; analyses passed QC based on precision criteria.
2	Inorganic	Dissolved analyte or filtered analyte greater than total analyte; analyses failed QC based on precision criteria.
3	Inorganic	BOD result is estimated due to the BOD blank exceeding the allowable oxygen depletion.
4	Inorganic	BOD duplicate precision not within control limits. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
5	Inorganic	BOD result is estimated due to insufficient oxygen depletion. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
6	Inorganic	BOD laboratory control sample not within control limits. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.
7	Inorganic	BOD result is estimated due to complete oxygen depletion. Due to the 48 hour holding time for this test, it is not practical to reanalyze and try to correct the deficiency.

Custody Seal on Cooler/Box Present: yes no Seals intact yes no

Packing Material: Bubble Wrap Bubble Bags None Other _____

Thermometer Used NA Type of Ice: Wet Blue None Samples on ice, cooling process has begun

Cooler Temperature PDJ Biological Tissue Is Frozen: Yes No

Temp should be above freezing to 6°C Comments: Date and Initials of person examining contents: 1-13-06 AB
1/13/06

Chain of Custody Present:	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	1.
Chain of Custody Filled Out:	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	2.
Chain of Custody Relinquished:	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	3.
Sampler Name & Signature on COC:	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	4.
Samples Arrived within Hold Time:	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	5.
Short Hold Time Analysis (<72hr):	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	6.
Rush Turn Around Time Requested:	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	7.
Sufficient Volume:	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	8.
Correct Containers Used:	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	9.
-Pace Containers Used:	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
Containers Intact:	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	10.
Filtered volume received for Dissolved tests	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	11.
Sample Labels match COC:	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	12.
-Includes date/time/ID/Analysis Matrix:	<u>S</u>	
All containers needing preservation have been checked.	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	13.
All containers needing preservation are found to be in compliance with EPA recommendation.	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> N/A	
exceptions: VOA, coliform, TOC, O&G, WI-DRO (water)	<input type="checkbox"/> Yes <input type="checkbox"/> No	Initial when completed
Samples checked for dechlorination:	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	14.
Headspace in VOA Vials (>6mm):	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	15.
Trip Blank Present:	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A	16.
Trip Blank Custody Seals Present	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> N/A
