1. Introduction

GHD Services Inc. (GHD) has prepared this 2023 Annual Monitoring Report for the Wausau Water Supply National Priorities List (NPL) Site (Site) in Wausau, Wisconsin, on behalf of the Wausau Group of Responsible Parties (Group). This report presents the results of annual groundwater monitoring conducted at the Site in August and September 2023.

1.1 History

The Group initiated remedial action at the Site in the early 1990s in accordance with the September 29, 1990, Record of Decision (ROD) and the Consent Decree (CD) entered with the court on January 24, 1991. The final remedial action at the Site consisted of two soil vapor extraction (SVE) systems to address the source areas along with groundwater extraction and treatment, utilizing existing municipal production wells (CW3 and CW6) and a remediation well (EW1). The Site location is shown on Figure 1. A Site plan is presented on Figure 2.

Source area remediation was accomplished by the installation of SVE systems at Marathon Electric¹ (West Bank) and Wausau Chemical Corporation (East Bank) in January 1994. The SVE system at Marathon Electric operated until April 1996 when the West Bank source remediation was approved as complete. The East Bank SVE system was modified in 1996 and continued to operate through January 2001. The East Bank source remediation was approved as complete in 2007 and SVE system operation ceased.

The groundwater remediation system consists of two municipal water supply wells (CW3 and CW6) and one extraction well installed at Marathon Electric (EW1). Air strippers located at the Wausau water treatment plant treats water from the municipal supply wells. Water from EW1 was treated by air stripping (over riprap on the riverbank) before discharging to the Wisconsin River.

The pumping rates for the three extraction wells were originally defined in the CD. The Groundwater Flow Model Report (CRA, May 1993), established a range of pumping rates that would maintain capture of the groundwater plume. Subsequently, in an August 4, 1995 letter, the United States Environmental Protection Agency (EPA) approved a pumping configuration range for the three extraction wells. Those pumping rates were:

- CW3: 65 hours per week at 1,200 gallons per minute (gpm) to 100 hours per week at 1,100 gpm
- CW6: 85 hours to 100 hours per week at 1,400 gpm
- EW1: 800 to 900 gpm continuously

EW1 stopped operating in July 2012 due to pump failure. Since EW1 has essentially completed its performance goal, the Group proposed a pilot study to confirm that the groundwater containment network of pumping wells will continue to be effective without the need to pump EW1. The EW1 Shutdown Pilot Study Work Plan proposal was submitted to the EPA on September 3, 2013. The Pilot Study was conducted from the 4th quarter of 2013 through the 4th quarter of 2014, and the results were reported to the EPA in March 2015. Although the EPA has not yet provided a final approval of the EW1 shutdown, the potential effects of the shutdown have continued to be evaluated through the annual groundwater monitoring conducted each fall from 2015 through 2023. EPA and WDNR approved the permanent shutdown and abandonment of EW1.

From 1985 through 1996, as an interim remedial measure, additional groundwater remediation was provided by a groundwater extraction system operated by Wausau Chemical Corporation (WCC). The extraction system at WCC consisted of a series of shallow wells at the south end of WCC property. Groundwater from this system was treated by air stripping. This remediation was conducted in addition to the requirements of the ROD or the CD and operation ceased in 1996.

¹ Marathon Electric was acquired by Regal Beloit Corporation and is now doing business at the Wausau plant under the Regal name.

From 1993 through 2000 groundwater monitoring was conducted according to the Monitoring Program Plan (CRA, 1994). The Monitoring Program Plan consisted of a complex system of monthly, quarterly, semiannual, and annual monitoring. In June 2000, the Groundwater Monitoring Plan replaced the Monitoring Program Plan as the approved groundwater monitoring program. The Groundwater Monitoring Plan consists of annual sampling of monitoring wells and quarterly sampling of EW1 (when operating). During a monthly project call on April 8, 2021 the WDNR and EPA approved permanently changing the annual sampling event from the fourth quarter to the month of August.

The Groundwater Monitoring Plan requires an annual report on the activities occurring the previous calendar year. This report fulfills the requirement for 2023.

1.2 Monitoring Background

Groundwater monitoring at this Site is a combination of hydraulic and water quality monitoring designed to verify that the groundwater extraction wells contain the contaminant plume and that groundwater quality is improving as a result of past source remedial actions and ongoing volatile organic compound (VOC) removal from the aquifer. Groundwater remediation at the Wausau Site has been ongoing for over 30 years.

Aquifer remediation progress is a slow process, but contaminant concentrations have been reduced significantly at the Site. The aquifer has been monitored annually, and the data show a downward trend of VOC concentrations in groundwater. Because of the time necessary to achieve groundwater remediation, containment of contaminated groundwater is the primary measurable and achievable short-term objective.

For the purpose of evaluation, groundwater monitoring at Wausau has been divided into two areas, the East Bank and the West Bank of the Wisconsin River, corresponding to the two original source areas. The river forms a natural hydraulic division of the Site. During 2023, two groundwater extraction wells were operated to remove VOC contaminated groundwater. One extraction well is on the West Bank (CW6), and one is on the East Bank (CW3) (see Figure 2). During the 2023 sampling event, extraction well CW3 was down for repairs and was unable to be measured or sampled.

1.3 Site Geology

The Site is underlain by glacial outwash and alluvial sediments that have filled in the pre-glacial stream valley into which the Wisconsin River now flows. This alluvial aquifer ranges from 0 to 160 feet thick and has an irregular base and lateral boundaries. Relatively impermeable bedrock underlies the aquifer and forms its lateral boundaries within the pre-glacial valley. Six production wells in the Site area provide drinking water for the City of Wausau. These wells are screened in the glacial outwash and alluvial sand and gravel deposits that underlie and are adjacent to the Wisconsin River.

1.4 Groundwater Cleanup Standards

The Groundwater Monitoring Plan was developed to monitor compliance with cleanup standards for the groundwater at the Site. The groundwater cleanup standards for the Site are the EPA maximum drinking water contaminant levels (MCLs). The MCLs for the primary VOC contaminants of concern at the Site are:

Trichloroethylene (TCE)	5 µg/L
Tetrachloroethylene (PCE)	5 µg/L
cis 1,2-Dichloroethene (c12DCE)	70 µg/L
Vinyl chloride	2 µg/L

With the exception of vinyl chloride, these standards are the same as the Wisconsin Department of Natural Resources WDNR) Enforcement Standards (ES). The Wisconsin ES for vinyl chloride is 0.2 µg/L (WDNR Chapter NR 140).

2. 2023 Annual Monitoring

The 2023 annual groundwater monitoring event was conducted on August 29 and 30 and September 1, 2023. Monitoring was conducted in accordance with the Groundwater Monitoring Plan (GMP) with the revisions to the analyte list and monitored locations as approved by EPA since the initial GMP was first approved in 2000. Table 2.1 presents the VOC analyte list and monitored locations for the 2023 sampling event. These locations were proposed in the 2019 Annual Monitoring Report (GHD, 2020). At the request of the EPA, monitoring well C3S was sampled in addition to the approved monitoring well list.

2.1 Water Level Monitoring

Table 2.2 presents the groundwater elevation data measured on August 29 and 30, 2023. Water table contours based on these measurements are depicted on Figure 3. Field staff obtained water level measurements on the East Bank on August 29, 2023, during the time well CW3 was not operating. The West Bank water level measurements were obtained on September 1, 2023, while well CW6 on the West Bank was operating. As explained in Section 1.1, well CW3 was not operating during the 2023 monitoring event. Water level measurements from the City production wells were obtained with the assistance of City personnel.

Typically, the East Bank groundwater flow patterns are controlled by the operation of CW3, however, since CW3 was not operational during the groundwater measurements, East Bank groundwater contours did not indicate the typical large cone of influence surrounding CW3 that fully captures the East Bank contaminant plume that we have seen historically. It can be assumed that, based on historical data, the cone of influence is still present when CW3 is operational, however this isn't depicted in the 2023 contours. Under natural conditions, groundwater on the East Bank flows in a south-southwest direction toward the Wisconsin River, as observed during 2023 sampling event when CW3 was not operating due to rehabilitation activities being conducted at the time of hydraulic monitoring. This effect on groundwater flow can be seen in Figure 3, as mentioned above.

West Bank contours depict a large cone of influence created by CW6 and CW10. Under natural conditions, West Bank groundwater would flow generally eastward and discharge to the Wisconsin River. Under pumping conditions, however, groundwater flows toward the City supply wells.

2.2 Groundwater Sampling

During the annual groundwater sampling event, samples were collected from nine wells from the East Bank and fourteen wells from the West Bank monitoring networks, respectively. Groundwater samples were analyzed for the Site-specific VOC list (see Table 2.1) by EPA Method 8260B. A summary of the groundwater sampling event, including field parameter measurements, is presented in Table 2.3.

Groundwater sampling was conducted according to the Quality Assurance Project Plan (CRA, February 1994) as amended by a June 11, 1999, letter to the EPA. Eurofins Laboratories, Inc., of Chicago, Illinois, analyzed all samples. Laboratory results will be submitted electronically in the Region V Electronic Data Deliverable (EDD) format for inclusion in the Region V EPA database. Copies of the laboratory report and data quality validation memoranda for the 2023 data are presented in Appendix A.

2.3 Extraction Well Sampling

EW-1 did not operate during 2023; thus, influent and post treatment effluent samples were not collected. However, a sample was collected from EW1 during the annual monitoring event, as discussed below.

3. Operation and Maintenance

Operation and maintenance activities reported in this section cover the City production wells, groundwater monitoring wells, and the annual inspection of the paved surfaces near the East Bank source area.

3.1 Monitoring Well Inspection

All Site monitoring wells were inspected during the August 2023 monitoring event. An inspection form was used to document the following well conditions:

- Well ID present
- Well location free of overgrowth
- Protective cover and casing condition
- Well cap condition
- Lock condition
- Concrete seal condition
- Locking cover condition
- Ground condition (subsidence)
- Flush mount surface condition
- Flush mount bolt condition

Table 3.1 presents the results of the inspection including locations where repairs are required. No critical damage was noted during the inspection. Location repairs will be addressed in 2024.

3.2 City Production Wells

Table 3.2 presents 2023 pumping data for the six City wells. While only wells CW3 and CW6 are part of the remediation system, data for all City wells are presented, consistent with previous reports. The table shows, by month, the number of hours each well was operated, the number of gallons pumped from each well, and the average pumping rate while the pump was operating.

Recommended pumping rates for CW3 and CW6 were established in an August 4, 1995 letter from EPA. In accordance with the letter, pumping of CW3 was to be maintained between 65 hours per week at 1,200 gallons per minute (gpm) to 100 hours per week at 1,100 gpm. Pumping of CW6 was set at 85 hours per week at 1,400 gpm. CW3 and CW6 generally operate on alternate weekly schedules where CW6 operates on the weekdays and CW3 operates more on the weekends.

During 2023, CW3 operated for an average of 62.7 hours per week with an average pumping rate of 1,448 gpm, operating at approximately 92.4% of the total required gallons based on the 1995 EPA pumping requirements. As CW3 was offline for part of the month of August, these numbers are slightly lower than usual.

CW6 pumped an average of 100.0 hours per week with an average pumping rate of 1,068 gpm. Although well rehabilitation is conducted on a regular basis, CW6 is no longer capable of pumping at the prescribed rate of 1,400 gpm. The total volume of groundwater (332,954,400) pumped by CW6 during 2023 was 89.7% of the EPA recommended volume of 371,280,000 gallons/year.

3.3 East Bank Source Area Pavement Inspection

The EPA and WDNR approved final closure of the East Bank source remediation SVE system in September 2007. As described in the Pavement Cover and Building Maintenance Plan, a requirement of the closure was annual inspection of the paved areas surrounding the Wausau Chemical property. The purpose of the inspection is to monitor the

integrity of the paved areas of the property and make recommendations to minimize rainwater infiltration and prevent direct human contact with soils. In August 2009, the entire pavement area was repaved by the City of Wausau with new asphalt, including the street adjacent to the west side of the property, North River Drive.

Also, an approximately 2,800 square foot addition, with concrete floor and roof, was added to the south end of the building in 2009-2010. Inspections conducted during 2023 found the pavement to be in fair condition. A copy of the pavement inspection log is provided in Appendix B.

4. Evaluation of Groundwater Monitoring Data

The objectives of the annual groundwater monitoring program are to monitor the long-term improvement of groundwater quality and containment of the contaminant plume. Table 4.1 presents the laboratory results for monitoring well samples collected in August and September 2023. VOC concentration maps for the principal Site contaminants (TCE, c12DCE, PCE and vinyl chloride) are presented on Figures 4, 5, 6, and 7. In 2021, select monitoring wells on both banks were sampled for 1,4-dioxane (1,4D). 1,4D was not detected at any of the wells sampled in 2021, and no further 14D sampling is anticipated. 1,4D Sampling results from 2021 are presented on Figure 8.

4.1 West Bank

The primary chlorinated VOC found in the West Bank groundwater is TCE, which was detected at 11 of the 13 West Bank monitoring wells, plus City well CW6. Monitoring wells with TCE concentrations greater than the MCL of 5 µg/L included R2D, W53A, W54, W55, and WSWD. The TCE concentration at CW6 is relatively stable at 2.7 µg/L in 2023, 3.0 µg/L in 2022, and 2.7 µg/L in 2021, all below the MCL.

The monitoring wells that exceeded the TCE MCL in the West Bank can be separated into two groups: south of EW1, located on or adjacent to the former landfill on Marathon Electric property, and north of EW1, downgradient of the former landfill in the direction of groundwater flow towards CW6 (see Figure 4). Well EW1 itself had no VOC detections during the 2023 sampling event.

VOC contaminants are more prevalent south of EW1, in the shallower portion of the aquifer near the source area. Monitoring wells south of EW1 exceeding the MCL for TCE included W53A, W54, and WSWD with concentrations of 43 µg/L, W54 140 µg/L, and 32 µg/L, respectively. TCE concentrations at W53A and W54 have exhibited substantial fluctuations since the shutdown of EW1 in 2012 (see the trend graphs in Appendix C). These fluctuations are typical of source area wells where increased precipitation and water level changes could have a localized effect on VOC concentrations in the groundwater. WSWD has been relatively stable, averaging around 30 µg/L over the prior three annual events.

North of EW1, the West Bank plume is in the deeper portion of the aquifer. Monitoring wells north of EW1 that exceeded the MCL for TCE during the 2023 sampling event included R2D and W55; R2D had a concentration of 10.0 µg/L, and W55 had a concentration of 17 µg/L. R2D is a deep aquifer well approximately 150 feet north of Marathon property. Recent decreasing TCE concentrations north of EW1 indicate that the plume remnant that was in a stagnation zone between EW1 and CW6 continues to migrate north to CW6 since EW1 stopped pumping. This is supported by generally increasing TCE concentrations at W55 since 2012 as well as generally decreasing concentrations at R3D and W52 (see these trend graphs in Appendix C). The TCE concentrations at R3D remain several orders of magnitude lower compared to data from 1999 through 2007, when concentrations ranged from 280 µg/L to 1,800 µg/L.

TCE degradation product, c12DCE, was detected at 3 locations in the West Bank, with no concentrations exceeding the cleanup standard of 70 µg/L. Additionally, PCE was detected in well C3S at very low concentrations not exceeding the MCL, and vinyl chloride was not detected in West Bank well samples. Overall, this is a decrease in chlorinated VOC detections compared to historical data.

The overall extent of the West Bank contaminant plume has not changed significantly since EW1 was shut down. TCE and c12DCE were the only VOCs detected down gradient from the source area on the West Bank. Figures 4 and 5 depict the TCE and c12DCE concentrations, respectively. The contour lines on the figures show the approximate areas of concentrations exceeding the MCL. Charts showing historical chlorinated VOC concentrations for select West Bank wells are presented in Appendix C.

4.2 East Bank

East Bank VOC data are presented in Table 4.1. While PCE was the initial contaminant of concern on the East Bank, the presence of TCE, c12DCE, and vinyl chloride at concentrations equal to or greater than PCE in some wells indicates an active natural biodegradation process is occurring. For example, the TCE concentration at monitoring well WW6 was higher than the PCE concentration.

PCE and/or its daughter products were detected at 4 of the 9 East Bank monitoring wells. Four monitoring wells had concentrations that exceeded the MCL of at least one VOC. East Bank contaminant concentrations continue to fluctuate, with generally increased concentrations in wells at or near the source, lower concentrations in mid plume wells, and increased concentrations farther downgradient at WW6 in c12DCE. A chart showing historical chlorinated VOC concentrations from CW3 located on the East Bank is presented in Appendix C, note that there is no change shown for 2023 as analytical was not collected due to well repairs. Individual VOC concentrations for the shallow wells are presented for PCE, TCE, c12DCE, and vinyl chloride on Figures 4 through 7, respectively.

4.3 Hydraulic Capture

Hydraulic capture of the Site contaminant plumes is demonstrated by the water table contours illustrated on Figure 3. At nested well locations, the water table elevations for shallow and deep wells were similar, indicating horizontal flow and hydraulic containment of the shallow and deeper portions of the aquifer.

5. Site Groundwater Monitoring Plan

The current Site groundwater monitoring plan includes an annual monitoring event that is conducted in September or October. In the 2016 Annual Monitoring Report (AMR), we proposed a reduced groundwater sampling list for the East Bank. Therefore, beginning in 2017, a reduced number of wells were sampled and gauged for hydraulic monitoring. In 2021, 10 East Bank monitoring wells were sampled, and water levels were measured at 14 East Bank wells as well as CW3. On the West Bank, 13 wells were sampled, and water levels were measured at 23 monitoring wells and the City supply wells. All groundwater samples were analyzed for the Site-specific VOC list by EPA Method 8260B. Table 2.1 summarizes the current monitoring plan. During the annual monitoring event, all wells are inspected to document their condition, including total depth, casing and grout, well ID, well cap, lock, concrete seal, and ground subsidence.

When EW1 was operating, monitoring was conducted quarterly, and pre-treatment and post-treatment water samples were collected and analyzed for Site-specific VOCs.

5.1 Groundwater Monitoring Plan

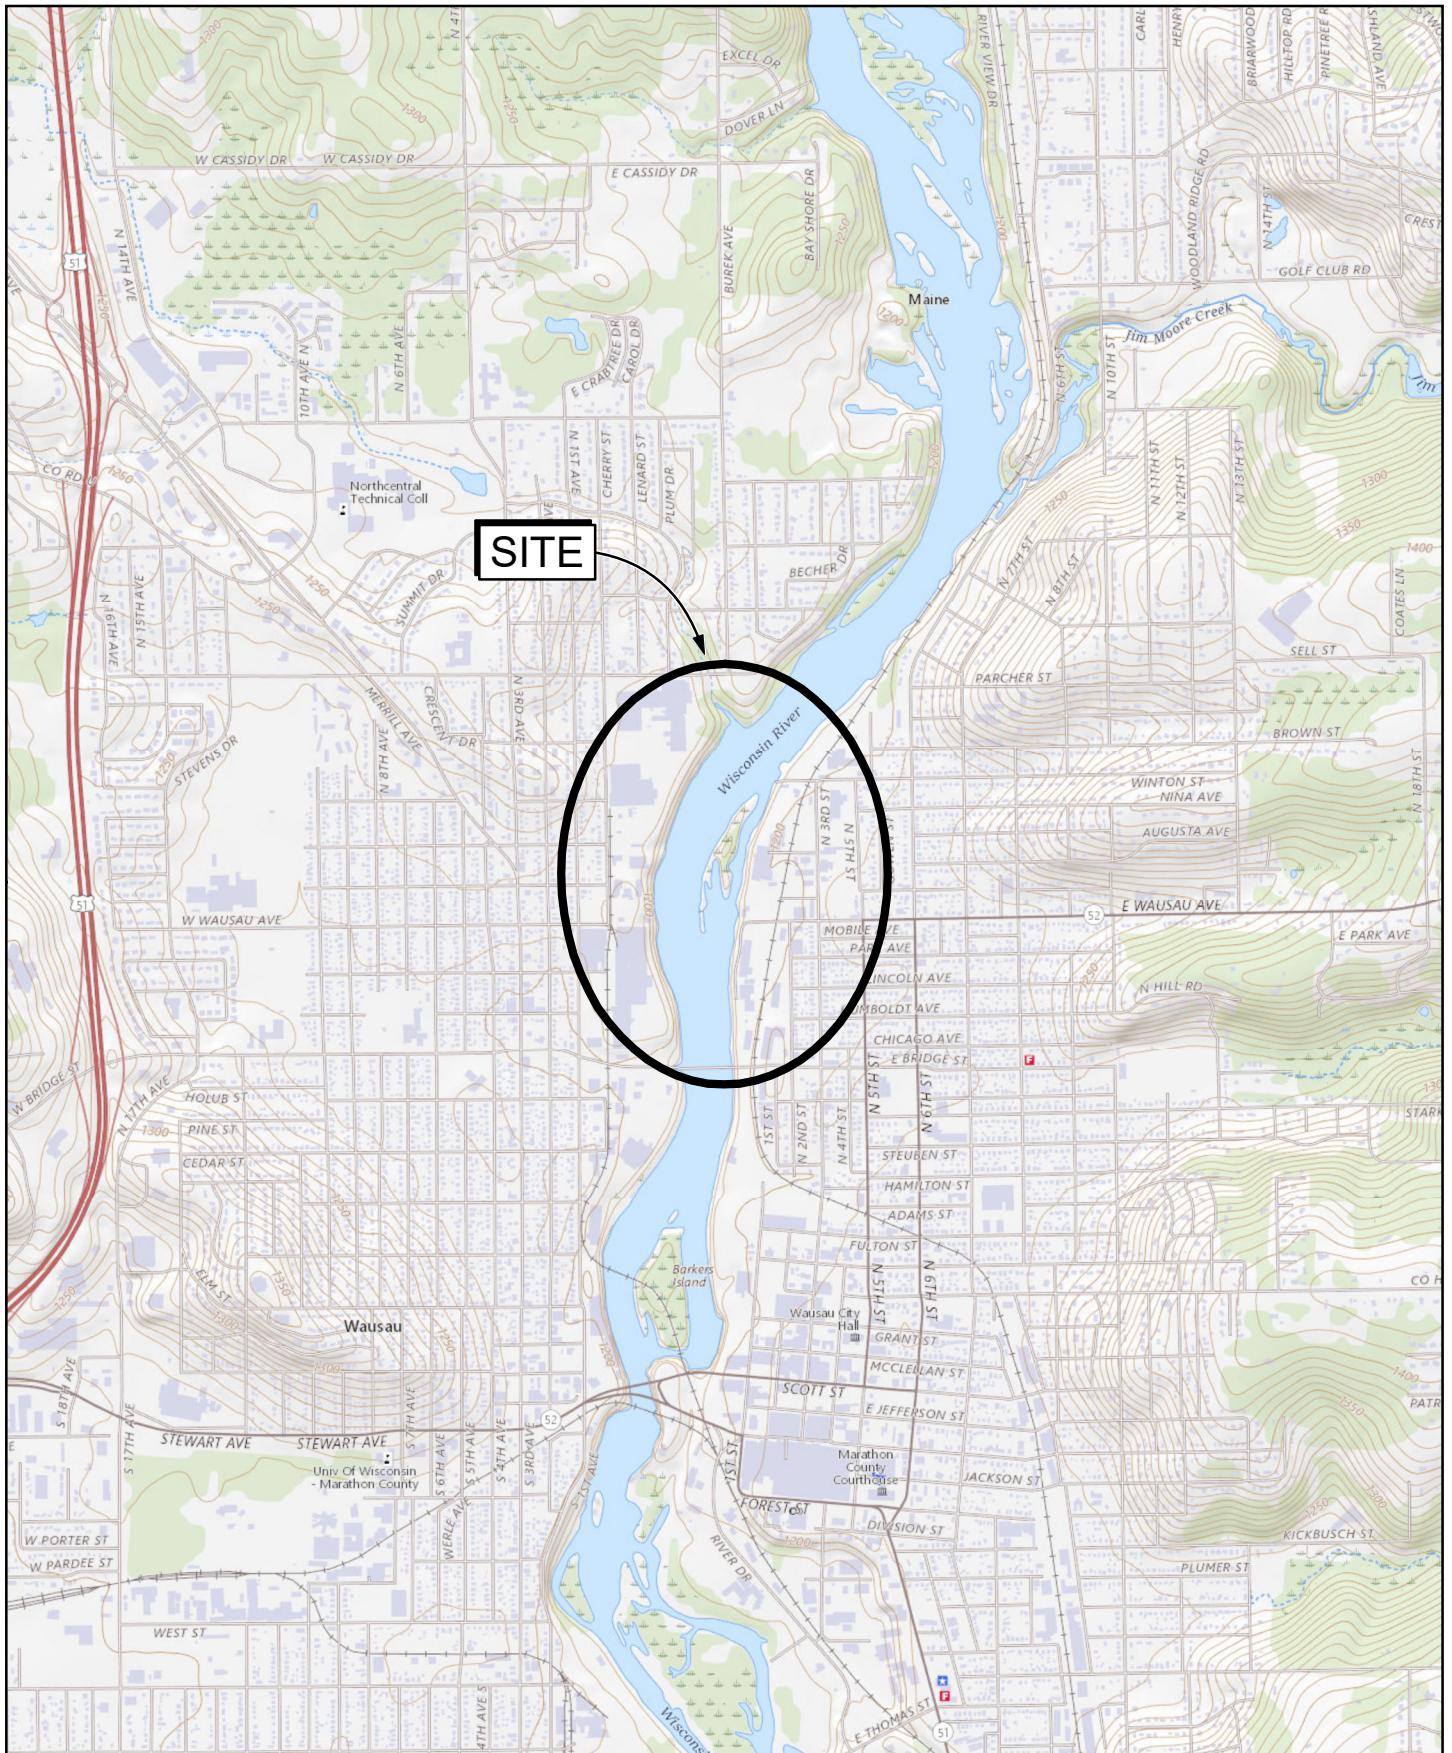

In February 2020, GHD proposed moving the annual groundwater monitoring event from the 4th quarter of the calendar year to August, beginning with the 2021 event. This request was given preliminary verbal approval by USEPA and WDNR in a call with GHD on April 8, 2021. No modifications to the monitoring plan are proposed currently. In 2023, the Group conducted the annual sampling event in August and plans to continue to conduct the sampling event in August of 2024.

6. Recommendations

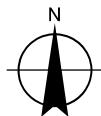

In 2024 GHD, on behalf of the PRP group, proposes to commence abandonment of monitoring wells that no longer provide data that is viable to the evaluation of the Site. A separate letter will be sent to the WDNR detailing the proposed modifications to the Sampling Plan. The letter will detail the rationale behind the proposed modifications.

In addition, we would like to reopen discussions with the USEPA and WDNR to remove CW3 from the monitoring program, similar to what was conducted at EW1. GHD would like to propose a trial shutdown pilot study under a separate submittal if USEPA and WDNR are in agreement with this recommendation.

ANALYTICAL REPORT

PREPARED FOR

Attn: Mr. Grant Anderson
GHD Services Inc.
900 Long Lake Road
Suite 200

New Brighton, Minnesota 55112

Generated 9/15/2023 12:50:03 AM

JOB DESCRIPTION

Wausau - 003978

JOB NUMBER

500-238904-1

Eurofins Chicago

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Chicago Project Manager.

Job ID: 500-238904-1

Laboratory: Eurofins Chicago

Narrative

Job Narrative 500-238904-1

Receipt

The samples were received on 8/31/2023 10:05 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 0.2° C.

Receipt Exceptions

One or more containers for the following sample(s) was received broken or leaking: Sample 4 has 1 VOA Vial broken.

The method requirement for no headspace was not met. The following volatile sample(s) were analyzed with headspace in the sample container(s): Sample 17 has 1 VOA vial with headspace.

The container label for the following sample(s) did not match the information listed on the Chain-of-Custody (COC) Sample 29. Received 4 VOA Vials, while the COC lists 1 VOA Vial.

GC/MS VOA

Method 8260B: Acetone was detected in the following samples: W-230829-RA-01 (500-238904-1), W-230830-RA-02 (500-238904-2), W-230830-RA-03 (500-238904-3), W-230830-RA-04 (500-238904-4) and W-230830-RA-05 (500-238904-5). Acetone is a known lab contaminant; therefore all low level detects for this compound could be suspected as lab contamination.

Method 8260B: The matrix spike/ matrix spike duplicate (MS/MSD) for the following sample was analyzed outside the 12 hour tune window. No further action was taken.W-230830-RA-05 (500-238904-5)

Method 8260B: Internal standard (1,4-Dichlorobenzene-d4) response was outside of acceptance limits for the following sample: W-230830-RA-06 (500-238904-6), W-230829-RA-08 (500-238904-8), W-230830-RA-10 (500-238904-10) and W-230829-RA-12 (500-238904-12). The sample did not have detects of requested analytes using this internal standard. Surrogate 4-Bromofluorobenzene is also being quantitated with this internal standard.

Method 8260B: The matrix spike (MS) recoveries for analytical batch 500-730885 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 500-731305 were outside control limits for one or more analytes. See QC Sample Results for detail. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery is within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	ISTD response or retention time outside acceptable limits
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
J	Reported value was between the limit of detection and the limit of quantitation.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment	
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True		1
The cooler's custody seal, if present, is intact.	True		2
Sample custody seals, if present, are intact.	True		3
The cooler or samples do not appear to have been compromised or tampered with.	True		4
Samples were received on ice.	True		5
Cooler Temperature is acceptable.	True		6
Cooler Temperature is recorded.	True	0.2	7
COC is present.	True		8
COC is filled out in ink and legible.	True		9
COC is filled out with all pertinent information.	True		10
Is the Field Sampler's name present on COC?	True		11
There are no discrepancies between the containers received and the COC.	False		12
Samples are received within Holding Time (excluding tests with immediate HTs)	True		13
Sample containers have legible labels.	True		14
Containers are not broken or leaking.	False		15
Sample collection date/times are provided.	True		
Appropriate sample containers are used.	True		
Sample bottles are completely filled.	True		
Sample Preservation Verified.	True		
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True		
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	False		
Multiphasic samples are not present.	True		
Samples do not require splitting or compositing.	True		
Residual Chlorine Checked.	N/A		

Data Verification Report

November 08, 2023

To	OJ Ojinaga, GHD	Project No.	003978-MEM-4
		Email	grant.anderson@ghd.com
From	Grant Anderson/mg/4	Contact No.	612-524-6836
Project Name	Wausau-Superfund Site		
Subject	Analytical Results and Data Verification Annual Groundwater Sampling Event Wausau Superfund Site Wausau, Wisconsin August 2023		

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

1. Introduction

This document details a data verification of analytical results for groundwater samples collected in support Annual Groundwater Sampling Event at the Wausau Superfund Site during August 2023. Samples were submitted to Eurofins Chicago, located in University Park, Illinois. A sample collection and analysis summary is presented in Table 1. The validated analytical results are summarized in Table 2. A summary of the analytical methodology is presented in Table 3.

Standard GHD report deliverables were submitted by the laboratories. The final results and supporting quality assurance/quality control (QA/QC) data were assessed. Evaluation of the data was based on information obtained from the chain of custody forms, finished report forms, method blank data, recovery data from surrogate spikes, laboratory control samples (LCS)/matrix spikes (MS) and field QA/QC samples.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the document entitled:

1. "National Functional Guidelines for Organic Superfund Methods Data Review", EPA 540-R-20-005, November 2020

Item 1. will subsequently be referred to as the "Guidelines" in this report.

2. Sample Holding Time and Preservation

The sample holding time criterion for the analyses are summarized in Table 3. Sample chain of custody documents and the analytical report were used to determine sample holding times. All samples were analyzed within the required holding time.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C).

3. Laboratory Method Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures.

Laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

With the exception of acetone, all method blank results were non-detect or yielded detections that did not result in qualification of sample data. Table 4 lists the acetone method blank detection. Associated sample data are qualified as noted in the table.

4. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for volatile organic compound (VOC) analyses were spiked with the appropriate number of surrogate compounds prior to sample extraction or analysis.

Surrogate recoveries were assessed against laboratory control limits. All surrogate recoveries met the above criteria.

5. Laboratory Control Sample Analyses

LCS are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects.

LCS were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

The LCS contained all compounds of interest. All LCS recoveries were within the laboratory control limits, demonstrating acceptable analytical accuracy.

6. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with known concentrations of the analytes of concern and analyzed as MS/MSD samples. The relative percent difference (RPD) between the MS and MSD is used to assess analytical precision.

MS/MSD analyses were performed as specified in Table 1.

The MS/MSD samples were spiked with all compounds of interest. All percent recoveries and RPD values were within the laboratory control limits or yielded recoveries outside of the control limits that did not result in qualification of sample data, demonstrating acceptable analytical accuracy and precision.

7. Field QA/QC Samples

The field QA/QC consisted of one trip blank sample, one field blank sample, one rinsate blank sample and two field duplicate sample sets.

Trip Blank Sample Analysis

To evaluate potential contamination from sample collection, transportation, storage, and analytical activities, one trip blank sample was submitted to the laboratory for VOC analysis. All results were non-detect for the compounds of interest.

Field Blank Sample Analysis

To assess ambient conditions at the site, one field blank was submitted for analysis, as identified in Table 1. All results were non-detect for the analytes of interest.

Rinsate Blank Sample Analysis

To assess field decontamination procedures and cleanliness of sample containers, one rinsate blank sample was submitted for analysis, as identified in Table 1. All results were non-detect for the compounds of interest.

Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, two field duplicate sample sets were collected and submitted "blind" to the laboratories, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 percent. If the reported concentration in either the investigative sample or its duplicate is less than five times the reporting limit (RL), the evaluation criteria is one times the RL value.

All field duplicate results were within acceptable agreement, demonstrating acceptable sampling and analytical precision.

8. Analyte Reporting

The laboratory reported detected results down to the laboratory's method detection limit (MDL) for each analyte. Positive analyte detections less than the RL but greater than the sample specific MDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this memorandum. Non-detect results were presented as non-detect at the RL in Table 2.

9. Conclusion

Based on the assessment detailed in the foregoing, the data are acceptable with the specific qualifications noted herein.

Regards,

Grant Anderson

Wausau Chemical Pavement Inspection Report

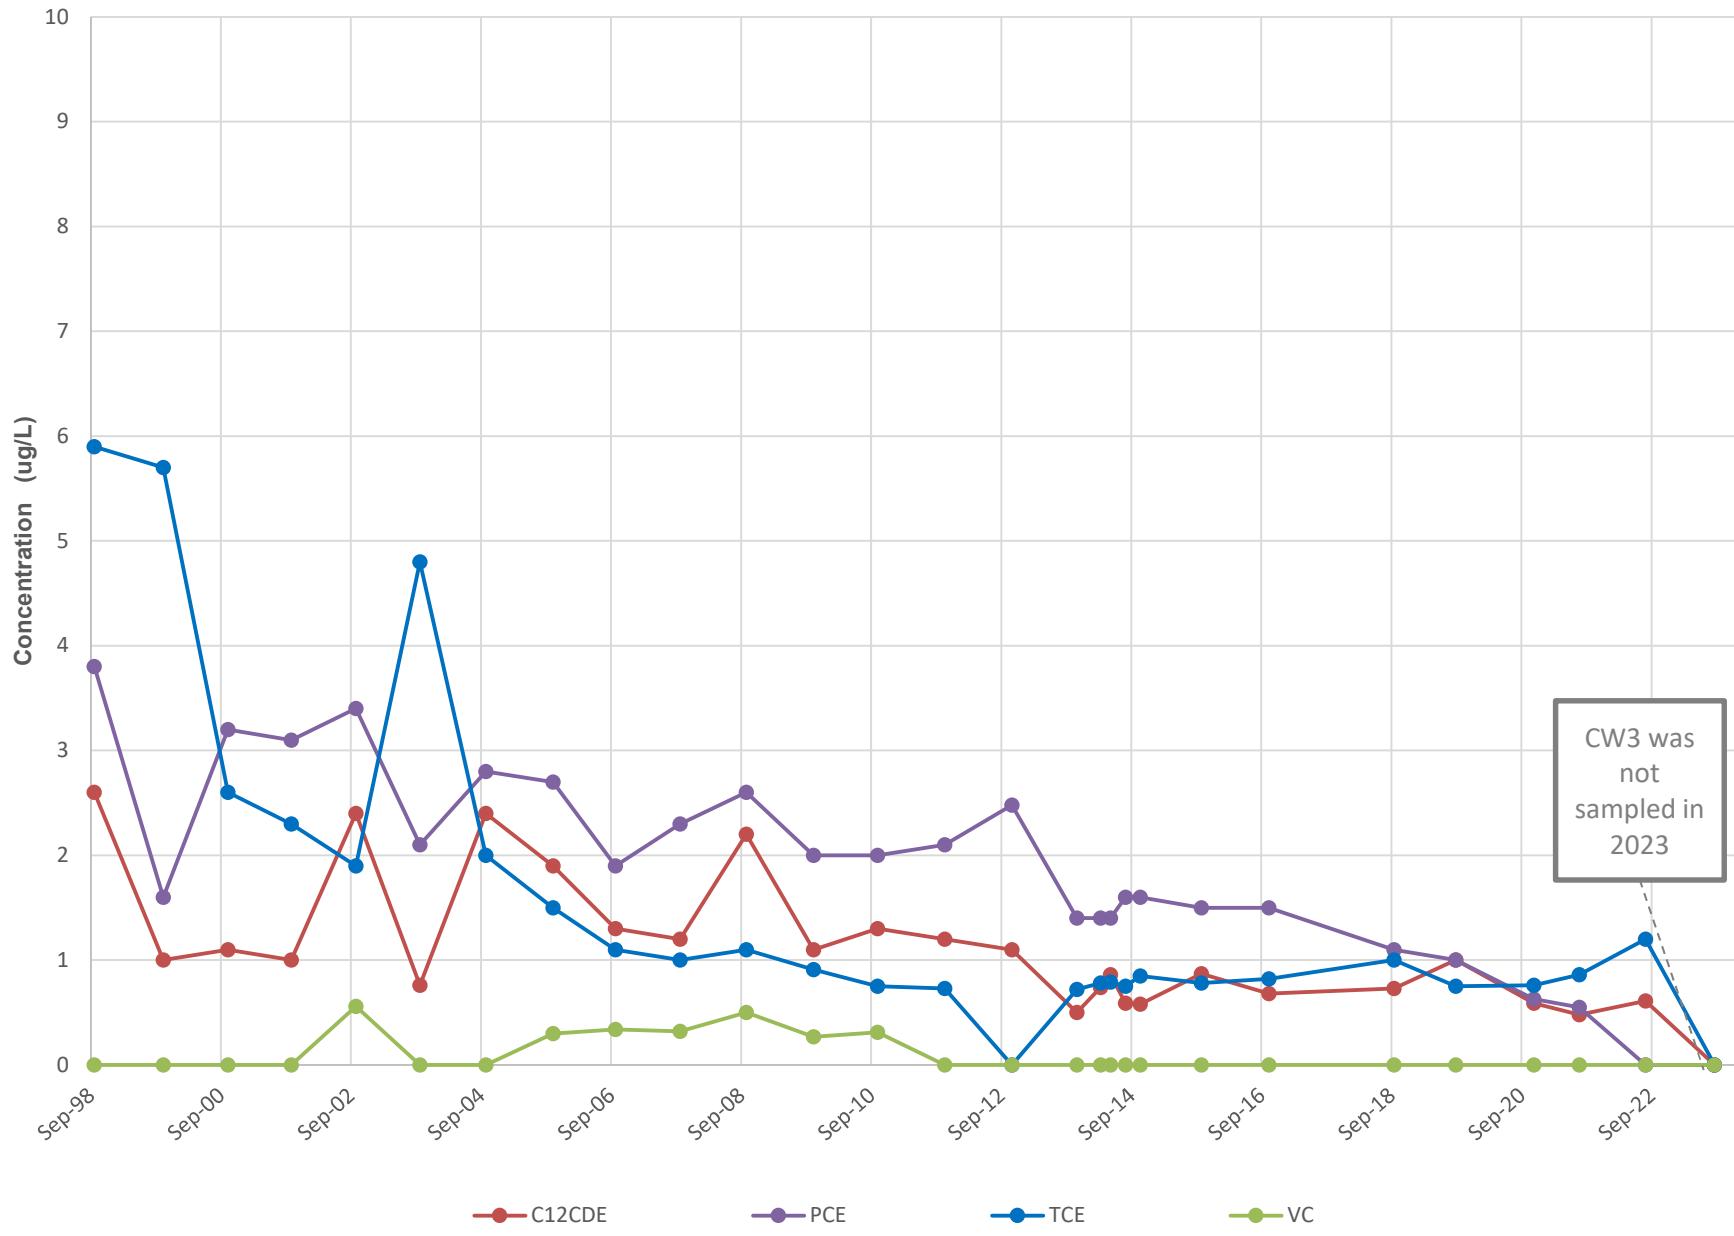

Pavement Barrier Inspection Log
Former Wausau Chemical Corporation

Inspection Date	Inspector	Condition of Cap	Recommendations	Have Recommendations From Previous Inspection Been Implemented?
8/29/2011	Rob Flashinski	Pavement was completely replaced in 2009. Three cracks starting to form, but have not penetrated.	No action required.	Yes.
7/2/2012	Rob Flashinski	Overall condition is very good. Recent work by the gas company has been patched thoroughly. All existing cracks have been filled.	None.	None Existed.
5/21/2013	Rob Flashinski	No change in appearance.	None.	Yes.
11/6/2013	Rob Flashinski	Overall condition is still good. Some hairline type cracks starting to form on the ends of previously filled cracks and near gas company asphalt work.	Nothing at this point. The hairline cracks will likely need attention in the spring.	Yes.
11/7/2014	Rob Flashinski	Overall condition is still good. Some hairline type cracks still exist on the ends of previously filled cracks and asphalt work by gas meter is starting to show again, but no cracks have formed.	Nothing at this point. Expect that some tar caulking will be needed in the spring.	Yes.
10/16/2015	Rob Flashinski	Overall condition is still good. Existing Cracks were sealed by Advanced Seal Coatings.	Nothing at this point.	Yes.
9/14/2016	Rob Flashinski	Overall condition is still good. Prior repair work is still in good condition also	Nothing at this point.	Yes.
8/14/2017	Rob Flashinski	Overall condition is still good. Some signs of asphalt aging.	Nothing.	Yes.
10/30/2018	Rob Flashinski	Overall condition is decent, however, more noticeable cracking is evident.	Filled cracks with asphalt filler in 2018	Yes.
10/29/2019	Charles Ahrens - GHD	Good condition. Cracks filled in 2018 are still in good shape.	No repairs necessary.	Yes.
11/19/2020	Kiel Jenkin - GHD	Good condition. Cracks filled in 2018 are still in good shape.	No repairs necessary.	N/A
8/2/2021	Kiel Jenkin - GHD	Good condition. Cracks filled in 2018 are still in good shape.	No repairs necessary.	N/A
8/8/2022	Ryan Aamot - GHD	Good condition. Cracks filled in 2018 are still in good shape.	No repairs necessary.	N/A
8/30/2023	Ryan Aamot - GHD	Decent condition. Asphalt starting to age.	No repairs necessary.	N/A
