SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Hydic Soils Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |
| Wetland Hydrology Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: Sample plot is located in a seasonally inundated or saturated interdunal swale. The hydrology of this sample plot is naturally problematic due to lack of primary hydrology indicators during the normal dry season. WETS analysis determined that the antecedent precipitation conditions were normal. 1.13 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Additional Remarks:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

| FACU spp. <u>0</u> | x 4 = | <u>0</u> |
| UPL spp. <u>0</u> | x 5 = | <u>0</u> |
| Total <u>105</u> (A) | | <u>120</u> (B) |
| Prevalence Index = B/A = | | <u>1.143</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Additional Remarks:

| UPL spp. <u>60</u> | x 5 = | <u>300</u> |
| Total <u>237</u> (A) | | <u>976</u> (B) |
| Prevalence Index = B/A = | | <u>4.118</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC: 2 (A)

Total Number of Dominant Species Across All Strata: 2 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100.0% (A/B)

Prevalence Index Worksheet

| Total % Cover of: | Multiply by: | |
|-----------------------------|--------------|----------------|
| OBL spp. <u>120</u> | x 1 = | <u>120</u> |
| FACW spp. <u>27</u> | x 2 = | <u>54</u> |
| FAC spp. <u>2</u> | x 3 = | <u>6</u> |
| FACU spp. <u>0</u> | x 4 = | <u>0</u> |
| UPL spp. <u>0</u> | x 5 = | <u>0</u> |
| Total <u>149</u> (A) | | <u>180</u> (B) |
| Prevalence Index = B/A = | | <u>1.208</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No

Wetland Hydrology Present? Yes No

Hydric Soils Present? Yes No

Is This Sampling Point Within A Wetland? Yes No

Remarks: Sample plot is located in a seasonally inundated or saturated intertidal swale. WETS analysis determined that the antecedent precipitation conditions were drier than normal. 0.18 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation. Atypical situations require the use of professional judgement. Based on landscape position, hydric soils present, and the timing of the delineation, this area appears it may be inundated or saturated for longer periods of time during the early growing season.

HYDROLOGY

Wetland Hydrology Indicators (Check here if indicators are not present):

Field Observations:

| | | |
|--------------------------------------------------------------------------------------------|----------------------------|-------------------------------------------------------------------------------------------------------|
| Surface Water Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Depth: (in.) | Wetland Hydrology Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No |
| Water Table Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Depth: >20 (in.) | |
| Saturation Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Depth: >20 (in.) | |

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available: **N/A**

Remarks: The presence of only one secondary indicator at the sample plot does not provide sufficient evidence of wetland hydrology. Field observations of high water table (18 inches) and saturation (14 inches) were found during Excel Engineering field investigation in May. The sample plot is located approximately 3 to 5 feet lower in elevation than surrounding upland.

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: Dominant vegetation was determined through use of 50/20 rule. Vegetation at the sample plot is not hydrophytic. Wetland spring ephemeral plants mostly likely occur within the seasonally flooded basin in early growing season. Berberis also seems to dominate in both wetland and upland areas within this portion of the site.

| Surface Water Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Depth: (in.) | Wetland Hydrology Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |
| Water Table Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Depth: >20 (in.) | |
| Saturation Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Depth: >20 (in.) | |

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available: **N/A**

Remarks: The presence of 1 primary and 1 secondary indicators at the sample plot provides evidence of wetland hydrology. Field observations of high water table (18 inches) and saturation (14 inches) were found during Excel Engineering field investigation in May. The sample plot is located approximately 3 to 5 feet lower in elevation than surrounding upland.

| Prevalence Index = B/A = | | <u>3.292</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic. Wetland spring ephemeral plants mostly likely are present within the seasonally flooded basin in early growing season.

Additional Remarks:

SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Hydic Soils Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |
| Wetland Hydrology Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: Sample plot is located in a seasonally inundated or saturated interdunal swale. The hydrology of this sample plot is naturally problematic due to lack of primary hydrology indicators during the normal dry season. WETS analysis determined that the antecedent precipitation conditions were drier than normal. 0.18 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.

HYDROLOGY

Field Observations:

| | | |
|--------------------------------------------------------------------------------------------|------------------------|-------------------------------------------------------------------------------------------------------|
| Surface Water Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Depth: (in.) | Wetland Hydrology Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |
| Water Table Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Depth: 26 (in.) | |
| Saturation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Depth: 22 (in.) | |

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available: **N/A**

Remarks: The presence of 2 secondary indicators at the sample plot provides evidence of wetland hydrology. Field observations of high water table (18 inches) and saturation (14 inches) were found during Excel Engineering field investigation in May. The sample plot is located approximately 3 to 5 feet lower in elevation than surrounding upland.

| Prevalence Index = B/A = | | <u>2.474</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the prevalence index. Vegetation at the sample plot is hydrophytic.**

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No

Wetland Hydrology Present? Yes No

Hydric Soils Present? Yes No

Is This Sampling Point Within A Wetland? Yes No

Remarks: Sample plot is located in a seasonally inundated or saturated intertidal swale. WETS analysis determined that the antecedent precipitation conditions were normal. 2.43 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation. Using best professional judgment this area is a wetland, as both hydrology and soils meet wetland classification. Even when vegetation does not meet classification at this specific time during the growing season.

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Hydic Soils Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |
| Wetland Hydrology Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: Sample plot is located in a seasonally inundated or saturated interdunal swale. WETS analysis determined that the antecedent precipitation conditions were normal. 2.43 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.

HYDROLOGY

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

| Prevalence Index = B/A = | | <u>4.484</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Additional Remarks:

| Surface Water Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Depth: (in.) | Wetland Hydrology Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |
| Water Table Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Depth: 20 (in.) | |
| Saturation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Depth: 17 (in.) | |

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available: **N/A**

Remarks: The presence of 1 primary and 3 secondary indicators at the sample plot provides evidence of wetland hydrology. Primary indicators of high water table (2 in.) and saturation (surface) were found in May field investigation. The sample plot is located approximately 3 to 5 feet lower in elevation than surrounding upland.

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available: **N/A**

Remarks: The presence of 1 primary and 3 secondary indicators at the sample plot provides evidence of wetland hydrology. The sample plot is located approximately 3 to 5 feet lower in elevation than surrounding upland.

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Hydic Soils Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No |
| Wetland Hydrology Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: Sample plot is located in an upland swale. WETS analysis determined that the antecedent precipitation conditions were normal. 2.43 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.

- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Additional Remarks:

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No **Is This Sampling Point Within A Wetland?** Yes No

Remarks: Sample plot is located in a seasonally inundated or saturated interdunal swale. WETS analysis determined that the antecedent precipitation conditions were normal. 2.43 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation. Naturally problematic hydrology due to seasonal nature of saturation/inundation.

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC: 0 (A)

Total Number of Dominant Species Across All Strata: 4 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 0.0% (A/B)

Prevalence Index Worksheet

| Total % Cover of: | Multiply by: | |
|-----------------------------|--------------|----------------|
| OBL spp. <u>0</u> | x 1 = | <u>0</u> |
| FACW spp. <u>0</u> | x 2 = | <u>0</u> |
| FAC spp. <u>0</u> | x 3 = | <u>0</u> |
| FACU spp. <u>92</u> | x 4 = | <u>368</u> |
| UPL spp. <u>95</u> | x 5 = | <u>475</u> |
| Total <u>187</u> (A) | | <u>843</u> (B) |
| Prevalence Index = B/A = | | <u>4.508</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Additional Remarks:

SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Hydic Soils Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |
| Wetland Hydrology Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: Sample plot is located in a seasonally inundated or saturated interdunal swale. WETS analysis determined that the antecedent precipitation conditions were normal. 2.43 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation. Naturally problematic hydrology identified due to seasonal occurrence of inundation/saturation.

HYDROLOGY

Wetland Hydrology Indicators (Check here if indicators are not present):

Field Observations:

| | | |
|--------------------------------------------------------------------------------------------|------------------------|-------------------------------------------------------------------------------------------------------|
| Surface Water Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Depth: (in.) | Wetland Hydrology Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |
| Water Table Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Depth: 16 (in.) | |
| Saturation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Depth: 14 (in.) | |

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available: **N/A**

Remarks: The presence of 3 secondary indicators at the sample plot provides evidence of wetland hydrology. Field observations of high water table (10 inches) and saturation (6 inches) were found during Excel Engineering field investigation in May. The sample plot is located approximately 3 to 5 feet lower in elevation than surrounding upland.

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available: **N/A**

Remarks: The presence of 1 primary and 3 secondary indicators at the sample plot provides evidence of wetland hydrology. The sample plot is located approximately 3 to 5 feet lower in elevation than surrounding upland.

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Additional Remarks:

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Additional Remarks:

| Total <u>169</u> (A) | | <u>756</u> (B) |
| Prevalence Index = B/A = | | <u>4.473</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Hydic Soils Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |
| Wetland Hydrology Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: Sample plot is located in a seasonally inundated or saturated interdunal swale within the growing season. The hydrology of this sample plot is naturally problematic due to lack of primary hydrology indicators during the normal dry season. WETS analysis determined that the antecedent precipitation conditions were normal. 2.30 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.

HYDROLOGY

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No Is This Sampling Point Within A Wetland? Yes No

Remarks: Sample plot is located in a seasonally inundated or saturated intertidal swale within the growing season. WETS analysis determined that the antecedent precipitation conditions were normal. 2.30 inches of rainfall was recorded near the Project 2 weeks prior to the wetland delineation. Atypical situations require the use of professional judgment. Based upon the landscape position, wetland hydrology and hydric soil parameters observed, the sample plot is located in a wetland.

| Total Cover = | | 0 | | |

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC: 0 (A)

Total Number of Dominant Species Across All Strata: 2 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 0.0% (A/B)

Prevalence Index Worksheet

| Total % Cover of: | Multiply by: | |
|----------------------------|--------------|----------------|
| OBL spp. <u>2</u> | x 1 = | <u>2</u> |
| FACW spp. <u>0</u> | x 2 = | <u>0</u> |
| FAC spp. <u>0</u> | x 3 = | <u>0</u> |
| FACU spp. <u>30</u> | x 4 = | <u>120</u> |
| UPL spp. <u>0</u> | x 5 = | <u>0</u> |
| Total <u>32</u> (A) | | <u>122</u> (B) |
| Prevalence Index = B/A = | | <u>3.813</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic. Wetland spring ephemeral plants mostly likely dominate the seasonally flooded basin in early growing season.**

Additional Remarks:

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No

Wetland Hydrology Present? Yes No

Hydric Soils Present? Yes No

Is This Sampling Point Within A Wetland? Yes No

Remarks: Still the growing season. WETS analysis determined that the antecedent precipitation conditions were normal. 2.43 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation. Atypical situations require the use of professional judgment. Based on landscape position, hydric soils and indicators of hydrology present, and the timing of the delineation, this area appears it may be inundated or saturated for longer periods of time during the early growing season.

| Water Table Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Depth: >24 (in.) | |
| Saturation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Depth: 24 (in.) | |

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available: **N/A**

Remarks: The presence of 1 primary and 2 secondary indicators at the sample plot provides sufficient evidence of wetland hydrology. Field observations of high water table (4 inches) and saturation (to the surface) were found during Excel Engineering field investigation in May. Naturally problematic hydrology identified given the seasonal nature of inundation/saturation.

SOILS

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic. Wetland spring ephemeral plants mostly likely occur within the seasonally flooded basin in early growing season.**

Additional Remarks:

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC: 7 (A)

Total Number of Dominant Species Across All Strata: 7 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100.0% (A/B)

Prevalence Index Worksheet

| Total % Cover of: | Multiply by: | |
|--------------------------|--------------|----------------|
| OBL spp. <u>10</u> | x 1 = | <u>10</u> |
| FACW spp. <u>85</u> | x 2 = | <u>170</u> |
| FAC spp. <u>40</u> | x 3 = | <u>120</u> |
| FACU spp. <u>5</u> | x 4 = | <u>20</u> |
| UPL spp. <u>0</u> | x 5 = | <u>0</u> |
| Total <u>140</u> | (A) | <u>320</u> (B) |
| Prevalence Index = B/A = | | <u>2.286</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Additional Remarks:

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC: 0 (A)

Total Number of Dominant Species Across All Strata: 8 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 0.0% (A/B)

Prevalence Index Worksheet

| Total % Cover of: | Multiply by: | |
|-----------------------------|--------------|----------------|
| OBL spp. <u>0</u> | x 1 = | <u>0</u> |
| FACW spp. <u>10</u> | x 2 = | <u>20</u> |
| FAC spp. <u>5</u> | x 3 = | <u>15</u> |
| FACU spp. <u>140</u> | x 4 = | <u>560</u> |
| UPL spp. <u>40</u> | x 5 = | <u>200</u> |
| Total <u>195</u> (A) | | <u>795</u> (B) |
| Prevalence Index = B/A = | | <u>4.077</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

| Prevalence Index = B/A = | | | <u>4.313</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Additional Remarks:

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Additional Remarks:

Appendix D – Site Photographs

Photo 1: br-10c-w looking north, Mosaic Beech/Maple complex.

Photo 2: br-10d-u looking south, Mosaic Beech/Maple complex.

Photo 3: br-11b-u looking north, Mosaic Beech/Maple complex.

Photo 4: 14bu looking west, old fallow field.

Photo 5: 17cw looking north, Alder thicket.

Photo 6: 10cw looking south, Alder thicket.

Photo 7: 10bu looking west, Upland forest.

Photo 8: 22bu looking south, Mesic forest.

Photo 9: P40dw looking east, Seasonally flooded basin.

Photo 10: P36u looking north, Upland ridge.

Photo 11: P33u looking north, Upland ridge.

Photo 12: P33w looking north, Wetland swale complex.

Photo 13: ne-2-w looking south, Wet meadow.

Photo 14: ne-2b-u looking north, Upland ridge.

Photo 15: 21cu looking north, Upland ridge.

Photo 16: 21cw looking west, Hardwood swamp.

Appendix E – Wetland Summary Table

Proposed Golf Course Project
Project Area Wetland Summary
November 2014

| Wetland ID | Map Page | Acreage (on-site) | Wetland Delineation Community Type | NHI Classification | WWI Classification | Wetland Description/Dominant Plant Species | Wetland Sample Points | Wetland Quality | Landownership | |

| Project name: Kohler Golf Course | Evaluator(s): M. Curran, J. Sulman, M. Knickelbine | | |
| File #: 193703078 | Date of visit(s): 9/22, 9/24, 10/2/14 | | |
| Location: PLSS: T14N, R23E S14 NW4; SW4 | Ecological Landscape: Central Lake Michigan Coastal | | |
| Lat: _____ Long: _____ | Watershed: Black River, SH02 | | |
| County: Sheboygan Town/City/Village: Wilson | | | |
| SITE DESCRIPTION | | | |
| Soils: Mapped Type(s): Gb, Ag, Hu, An, Pa | WWI Class: T3K, T3/E1K, T3/S3K | | |
| Field Verified: Y | Wetland Type(s): Alder Thicket | | |
| | <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; padding: 2px;">Wetland Size: 30.7 acres</td> <td style="width: 50%; padding: 2px;">Wetland Area Impacted NA</td> </tr> </table> | Wetland Size: 30.7 acres | Wetland Area Impacted NA |
| Wetland Size: 30.7 acres | Wetland Area Impacted NA | | |
| Hydrology: seasonal or permanent high water table and/or saturation, as evidenced by water table at depth of 10", and saturation at 6" measured on 8/14/14. Located in floodplains and drainageways. | Vegetation/Plant Community Description(s): Alder thicket occurs extensively within the Black River floodplain. The community is characterized by a shrub stratum of speckled alder (<i>Alnus incana</i>), and a herbaceous groundlayer. Occasional trees of green and black ash occur, but do not exceed 30% canopy. | | |

|---------------------|

SECTION 1: Functional Value Assessment

| HU | Y/N | Potential | Human Use Values: recreation, culture, education, science, natural scenic beauty |
|----|-----|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Y | | Used for recreation (hunting, birding, hiking, etc.). List: hunting, birding, hiking; state park uses |
| 2 | Y | | Used for educational or scientific purposes |
| 3 | Y | | Visually or physically accessible to public |
| 4 | Y | | Aesthetically pleasing due to diversity of habitat types, lack of pollution or degradation |
| 5 | Y | | In or adjacent to RED FLAG areas List: State park; Lake Michigan |
| 6 | Y* | | Supports or provides habitat for endangered, threatened or special concern species |
| 7 | Y* | | In or adjacent to archaeological or cultural resource site |
| WH | | | Wildlife Habitat |
| 1 | Y | | Wetland and contiguous habitat >10 acres |
| 2 | Y | | 3 or more strata present (>10% cover) |
| 3 | Y | | Within or adjacent to habitat corridor or established wildlife habitat area |
| 4 | Y | | 100 m buffer – natural land cover ≥50%(south) 75% (north) intact |
| 5 | Y | | Occurs in a Joint Venture priority township |
| 6 | Y | | Interspersion of habitat structure (hemi-marsh,shrub/emergent, wetland/upland complex,etc.) |
| 7 | Y* | | Supports or provides habitat for SGCN or birds listed in the WI All-Bird Cons. Plan, or other plans |

Section 1 Comments (Refer to Section 1 numbers)

| |
|---------------------------------------------------------------------------------------------------------------------------|
| *see comment below |
| |
| HU 6. TES species onsite, e.g. blue-winged teal; wetlands provide or support TES species habitat functions. |
| HU 7. Archaeological resources documented in concurrent study. |
| WH 7. SGCN/Priority Species with suitable habitat include kingfisher, tufted titmouse |
| WH 12. Alder Thicket is relatively infrequent within surrounding agricultural and urban context. |
| WQ 6. Dense reed canary grass may indicate excess nutrient inputs from upstream sources. |
| WQ 7. Upstream inputs into Black River affect Alder Thicket, but groundwater is main hydrology source. |
| GW 1. Indicators of groundwater discharge include vegetation, saturation at or near the surface, and shallow water table. |
| GW 4. Wetland soils include organic and mineral components. |
| GW 5. Sheboygan Water Utilities use Lake Michigan as source. |

Wildlife Habitat and Species Observation (including amphibians and reptiles)

List: direct observation, tracks, scat, other sign; type of habitat: nesting, migratory, winter, etc.

| Observed | Potential | Species/Habitat/Comments |

**Relative frequency of the impact in comparison to the general condition of wetlands and buffer areas in the region or watershed (C=Common, UC=Uncommon)

SUMMARY OF CONDITION ASSESSMENT (Include general description and comments)

| |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The alder thicket is in moderate to good condition, occurring as a component in a complex of Black River floodplain wetlands. The most significant stressors appear to be inflows of silt and excess nutrients from sources upstream in the Black River and tributaries, and the cover of non-native species, primarily reed canary grass. Historic agricultural use occurred within the buffer area, probably limited to pasture, but current impacts are minimal. Recreational usage is limited to the unpaved trails that run through the State Park Portion of the area; access through the Alder Thicket on foot is difficult. |
| |
| |
| |
| |

SUMMARY OF FUNCTIONAL VALUES

| FUNCTION | SIGNIFICANCE | | | | |
|-------------------------------|--------------|--------|------|-------------|----|
| | Low | Medium | High | Exceptional | NA |
| Floristic Integrity | | Y | | | |
| Human Use Values | | Y | | | |
| Wildlife Habitat | | | Y | | |
| Fish and Aquatic Life Habitat | | | Y | | |
| Shoreline Protection | | | Y | | |
| Flood and Stormwater Storage | | | Y | | |
| Water Quality Protection | | | Y | | |
| Groundwater Processes | | | Y | | |

| FUNCTION | RATIONALE |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Floristic Integrity | There is a moderate level of species diversity, presence of heterogeneous, adjacent plant communities, and presence of two or three vegetation strata. Some conservative species were present, but rare plant species were lacking. Invasive species occur within this community at moderate to high levels of coverage. |
| Human Use Values | Public access to the State Park portion of the site is available, but the Alder Thicket is not likely to be used extensively for recreation, hiking, or education. Archaeological resources occur in adjacent areas, and might occur in this community. The alder thicket may offer hunting, birding, and nature study opportunities. |
| Wildlife Habitat | The combination of a diversity of contiguous upland and wetland plant communities in a large, unfragmented block of habitat adds significance to the site's value for wildlife. A number of species of fauna were observed, are known to occur, or could potentially occur in or adjacent to alder thicket, especially amphibians and birds. |
| Fish and Aquatic Life Habitat | The Black River and surrounding wetland and upland plant communities provide significant habitat for fish and aquatic life. The river and its tributaries have been somewhat impacted by agricultural and stormwater runoff, but retain a healthy aquatic plant community and is likely important for fish spawning, waterfowl, and amphibians. |
| Shoreline Protection | The alder thickets adjacent to the Black River contribute vegetative cover along the banks, offering shoreline protection, which has a significant positive effect for the river and downstream communities. |
| Flood and Stormwater Storage | The wetlands within the Black River floodplain and surrounding areas provide significant value in storing and attenuating peak flows in the river, which may have a positive impact on reducing flooding downstream. |
| Water Quality Protection | The wetlands surrounding the Black River provide significant value to protecting water quality within the Black River and Lake Michigan. Water quality in the Black River and its tributaries has been negatively impacted by runoff from residential and agricultural areas upstream. |
| Groundwater Processes | The site retains essentially intact groundwater processes, including groundwater recharge and discharge areas, which has beneficial effects on surface and groundwater quality. |

Section 4: Project Impact Assessment

Brief Project Description

The proposed project consists of a golf course on a 247-acre parcel adjacent to Lake Michigan, with an access road to the west, crossing a DNR-owned 135-acre parcel, and the Black River.

Expected Project Impacts

| IMPACT: describe (+ or -) | Permanence/Reversibility | Significance (Low, Medium, High) |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|
| Direct Impacts Road fill and construction of infrastructure is expected to directly impact wetland resulting in a permanent wetland loss. | Loss of wetland is expected to be permanent. | High |
| Secondary Impacts (including impacts which are indirectly attributable to the project) Road construction may alter wetland hydrology; increased runoff/nutrient loading; resulting in degradation of wetland habitats and water quality; wells may result in drawdown of water table. | Alterations to wetland hydrology, habitat, water quality, and water table are likely to be permanent. | High |
| Cumulative Impacts Additional development beyond the current proposed plan has the potential to impact additional wetlands. | Additional wetland loss would be permanent. | High |
| Spatial/Habitat Integrity Proposed project may result in fragmentation of habitat blocks. | Habitat fragmentation would be permanent. | High |
| Rare Plant/Animal Communities/ Natural Areas Construction of golf course infrastructure may result in loss or degradation of rare plant communities and rare plant/animal habitats. | No rare plants or plant communities were identified within the alder thicket; it likely supports habitat for rare animals, e.g., blue-winged teal. | Medium |

Sheboygan County, Wisconsin**

2014 Species List - Alder Thicket

| Scientific Name | Common Name | Native | Physiognomy | Coefficient of Conservatism | Region 3 Wetland Coefficient |
|----------------------------------|--------------------------|------------|-------------|-----------------------------|------------------------------|
| <i>Alliaria petiolata</i> | invasive garlic mustard | non-native | forb | 0 | 3 |
| <i>Alnus incana</i> | speckled alder | native | tree | 4 | -3 |
| <i>Amphicarpaea bracteata</i> | american hog-peanut | native | vine | 5 | 0 |
| <i>Arisaema triphyllum</i> | jack-in-the-pulpit | native | forb | 5 | 0 |
| <i>Asclepias incarnata</i> | marsh milkweed | native | forb | 5 | -5 |
| <i>Athyrium angustum</i> | common lady fern | native | fern | 5 | 0 |
| <i>Boehmeria cylindrica</i> | small-spike false nettle | native | forb | 6 | -5 |
| <i>Calamagrostis canadensis</i> | blue-joint grass | native | grass | 5 | -5 |
| <i>Carex lacustris</i> | common lake sedge | native | sedge | 6 | -5 |
| <i>Carex stricta</i> | hummock sedge | native | sedge | 7 | -5 |
| <i>Carex tuckermanii</i> | bent-seeded hop sedge | native | sedge | 8 | -5 |
| <i>Chelone glabra</i> | turtlehead | native | forb | 7 | -5 |
| <i>Dryopteris cristata</i> | crested shield fern | native | fern | 7 | -5 |
| <i>Echinocystis lobata</i> | balsam-apple | native | vine | 2 | -3 |
| <i>Elymus virginicus</i> | virginia wild-rye | native | grass | 6 | -3 |
| <i>Epilobium coloratum</i> | cinnamon willow-herb | native | forb | 3 | -5 |
| <i>Eutrochium maculatum</i> | spotted joe-pye-weed | native | forb | 4 | -5 |
| <i>Fraxinus nigra</i> | black ash | native | tree | 8 | -3 |
| <i>Fraxinus pennsylvanica</i> | green ash | native | tree | 2 | -3 |
| <i>Geum canadense</i> | white avens | native | forb | 2 | 0 |
| <i>Glechoma hederacea</i> | creeping-charlie | non-native | forb | 0 | 3 |
| <i>Glyceria grandis</i> | american manna grass | native | grass | 6 | -5 |
| <i>Glyceria striata</i> | fowl manna grass | native | grass | 4 | -5 |
| <i>Helenium autumnale</i> | common sneezeweed | native | forb | 4 | -3 |
| <i>Hesperis matronalis</i> | dames rocket | non-native | forb | 0 | 3 |
| <i>Ilex verticillata</i> | common winterberry | native | shrub | 7 | -3 |
| <i>Impatiens capensis</i> | orange jewelweed | native | forb | 2 | -3 |
| <i>Iris virginica</i> | southern blue flag | native | forb | 5 | -5 |
| <i>Juncus effusus</i> | soft rush | native | rush | 4 | -5 |
| <i>Laportea canadensis</i> | canadian wood-nettle | native | forb | 4 | -3 |
| <i>Lycopus uniflorus</i> | northern bugleweed | native | forb | 4 | -5 |
| <i>Lysimachia ciliata</i> | fringed loosestrife | native | forb | 5 | -3 |
| <i>Matteuccia struthiopteris</i> | ostrich fern | native | fern | 5 | 0 |
| <i>Mentha arvensis</i> | wild mint | native | forb | 3 | -3 |
| <i>Myosotis scorpioides</i> | common forget-me-not | non-native | forb | 0 | -5 |
| <i>Onoclea sensibilis</i> | sensitive fern | native | fern | 5 | -3 |
| <i>Osmunda spectabilis</i> | american royal fern | native | fern | 7 | -5 |
| <i>Osmundastrum cinnamomeum</i> | cinnamon fern | native | fern | 7 | -3 |
| <i>Pedicularis lanceolata</i> | fen betony | native | forb | 8 | -3 |
| <i>Persicaria amphibia</i> | water smartweed | native | forb | 5 | -5 |
| <i>Persicaria sagittata</i> | arrow-leaved tear-thumb | native | forb | 6 | -5 |
| <i>Phalaris arundinacea</i> | reed canary grass | non-native | grass | 0 | -3 |
| <i>Pilea pumila</i> | canadian clearweed | native | forb | 3 | -3 |
| <i>Ranunculus hispidus</i> | hispid buttercup | native | forb | 6 | 0 |
| <i>Rosa palustris</i> | swamp rose | native | shrub | 7 | -5 |
| <i>Rumex obtusifolius</i> | bitter dock | non-native | forb | 0 | 0 |
| <i>Sagittaria latifolia</i> | broad-leaved arrowhead | native | forb | 3 | -5 |

**Relative frequency of the impact in comparison to the general condition of wetlands and buffer areas in the region or watershed (C=Common, UC=Uncommon)

SUMMARY OF CONDITION ASSESSMENT (Include general description and comments)

| |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The degraded alder thicket is generally in fair to poor condition. |
| The most significant stressors appear to be inflows of silt and excess nutrients from sources upstream; dominance in the groundlayer by non-native species. Historic agricultural use occurred within the buffer area, probably limited to pasture, but current impacts are minimal. Recreational usage is limited to the unpaved trails that run in the vicinity of the area; access through the Alder Thicket on foot is difficult. |
| The functional value of this community is reduced due to the low coverage of native or perennial plants in the understory, the erosion and depth of the stream channel conduct water through the area quickly, rather than allowing for storage. |
| |
| |
| |

SUMMARY OF FUNCTIONAL VALUES

| FUNCTION | SIGNIFICANCE | | | | |
|-------------------------------|--------------|--------|------|-------------|----|
| | Low | Medium | High | Exceptional | NA |
| Floristic Integrity | Y | | | | |
| Human Use Values | | Y | | | |
| Wildlife Habitat | Y | | | | |
| Fish and Aquatic Life Habitat | Y | | | | |
| Shoreline Protection | | Y | | | |
| Flood and Stormwater Storage | Y | | | | |
| Water Quality Protection | Y | | | | |
| Groundwater Processes | Y | | | | |

| FUNCTION | RATIONALE |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Floristic Integrity | There is a low level of species diversity, adjacent upland and degraded plant communities, and presence of two or three vegetation strata. Highly conservative/rare plant species were lacking, and high levels of invasive species dominate the groundlayer within this community. |
| Human Use Values | Public access to the State Park portion of the site is available, but the Alder Thicket is not likely to be used extensively for recreation, hiking, or education. Archaeological resources occur in adjacent areas, and might occur in this community. |
| Wildlife Habitat | The small size and fragmentation of habitat lowers the site's value for wildlife. A number of species of fauna were observed, are known to occur, or could potentially occur in or adjacent to the degraded alder thicket, and the community may provide a corridor for wildlife including generalist mammals and birds. |
| Fish and Aquatic Life Habitat | The degraded alder thicket probably has little potential value for fish and aquatic life, due to the flashy nature of stream flows and degraded water quality due to stormwater and agricultural runoff. |
| Shoreline Protection | The degraded alder thicket may offer some shoreline protection through the vegetative cover along the banks, however the flashy nature of stream flows have resulted in significant erosion and undercutting of the banks. |
| Flood and Stormwater Storage | The degraded alder thicket offers limited capacity for storing and attenuating peak flows in the adjacent stream, because the deep channel serves to conduct water through rather than allowing floodwaters to spread out. |
| Water Quality Protection | The degraded alder thicket provides limited value in protecting water quality within the Black River watershed. Water quality in the Black River and its tributaries has been negatively impacted by runoff from residential and agricultural areas upstream. |
| Groundwater Processes | Groundwater processes within the degraded alder thicket may include groundwater recharge and discharge, which may provide limited benefits to surface and groundwater quality. |

Section 4: Project Impact Assessment

Brief Project Description

The proposed project consists of a golf course on a 247-acre parcel adjacent to Lake Michigan, with an access road to the west, crossing a DNR-owned 135-acre parcel, and the Black River.

Expected Project Impacts

| IMPACT: describe (+ or -) | Permanence/Reversibility | Significance (Low, Medium, High) |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|-----------------------------------------|
| Direct Impacts Road fill and construction of infrastructure is expected to directly impact wetland resulting in a permanent wetland loss. | Loss of wetland is expected to be permanent. | Low |
| Secondary Impacts (including impacts which are indirectly attributable to the project) Road construction may alter wetland hydrology; increased runoff/nutrient loading; resulting in degradation of wetland habitats and water quality; wells may result in drawdown of water table. | Alterations to wetland hydrology, habitat, water quality, and water table are likely to be permanent. | Low |
| Cumulative Impacts Additional development beyond the current proposed plan has the potential to impact additional wetlands. | Additional wetland loss would be permanent. | Medium |
| Spatial/Habitat Integrity Proposed project may result in fragmentation of habitat blocks. | Habitat fragmentation would be permanent. | Medium |
| Rare Plant/Animal Communities/ Natural Areas Construction of golf course infrastructure may result in loss or degradation of rare plant communities and rare plant/animal habitats. | No rare plants or plant communities were identified within the degraded alder thicket. | Low |

SECTION 1: Functional Value Assessment

| HU | Y/N | Potential | Human Use Values: recreation, culture, education, science, natural scenic beauty |
|----|-----|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Y | | Used for recreation (hunting, birding, hiking, etc.). List: hunting, birding, hiking; state park uses |
| 2 | Y | | Used for educational or scientific purposes |
| 3 | Y | | Visually or physically accessible to public |
| 4 | Y | | Aesthetically pleasing due to diversity of habitat types, lack of pollution or degradation |
| 5 | Y | | In or adjacent to RED FLAG areas List: State park; Lake Michigan |
| 6 | Y* | | Supports or provides habitat for endangered, threatened or special concern species |
| 7 | Y* | | In or adjacent to archaeological or cultural resource site |
| WH | | | Wildlife Habitat |
| 1 | Y | | Wetland and contiguous habitat >10 acres |
| 2 | Y | | 3 or more strata present (>10% cover) |
| 3 | Y | | Within or adjacent to habitat corridor or established wildlife habitat area |
| 4 | Y | | 100 m buffer – natural land cover ≥50%(south) 75% (north) intact |
| 5 | Y | | Occurs in a Joint Venture priority township |
| 6 | Y | | Interspersion of habitat structure (hemi-marsh,shrub/emergent, wetland/upland complex,etc.) |
| 7 | Y* | | Supports or provides habitat for SGCN or birds listed in the WI All-Bird Cons. Plan, or other plans |
| 8 | Y | | Part of a large habitat block that supports area sensitive species |
| 9 | Y | | Ephemeral pond with water present > 45 days |
| 10 | Y | | Standing water provides habitat for amphibians and aquatic invertebrates |
| 11 | N | | Seasonally exposed mudflats present |
| 12 | Y* | | Provides habitat scarce in the area (urban, agricultural, etc.) |
| FA | | | Fish and Aquatic Life Habitat |
| 1 | Y | | Wetland is connected or contiguous with perennial stream or lake |
| 2 | Y | | Standing water provides habitat for amphibians and aquatic invertebrates |
| 3 | N | Y | Natural Heritage Inventory (NHI) listed aquatic species within aquatic system |
| 4 | Y | | Vegetation is inundated in spring |
| SP | | | Shoreline Protection |
| 1 | Y | | Along shoreline of a stream, lake, pond or open water area (≥1 acre) - if no, not applicable |
| 2 | N | | Potential for erosion due to wind fetch, waves, heavy boat traffic, erosive soils, fluctuating water levels or high flows – if no, not applicable |
| 3 | Y | | Densely rooted emergent or woody vegetation |
| ST | | | Storm and Floodwater Storage |
| 1 | Y | | Basin wetland, constricted outlet, has through-flow <u>or</u> is adjacent to a stream |
| 2 | Y | | Water flow through wetland is NOT channelized |
| 3 | Y | | Dense, persistent vegetation |
| 4 | N | | Evidence of flashy hydrology |
| 5 | Y | | Point or non-point source inflow |
| 6 | Y | | Impervious surfaces cover >10% of land surface within the watershed |
| 7 | Y | | Within a watershed with ≤10% wetland |
| 8 | Y | | Potential to hold >10% of the runoff from contributing area from a 2-year 24-hour storm event |
| WQ | | | Water Quality Protection |
| 1 | Y | | Provides substantial storage of storm and floodwater based on previous section |
| 2 | Y | | Basin wetland <u>or</u> constricted outlet |
| 3 | Y | | Water flow through wetland is NOT channelized |
| 4 | Y | | Vegetated wetland associated with a lake or stream |
| 5 | Y | | Dense, persistent vegetation |
| 6 | Y* | | Signs of excess nutrients, such as algae blooms, heavy macrophyte growth |
| 7 | N* | | Stormwater or surface water from agricultural land is major hydrology source |
| 8 | Y | | Discharge to surface water |
| 9 | Y | | Natural land cover in 100m buffer area < 50% |
| GW | | | Groundwater Processes |
| 1 | Y* | | Springs, seeps or indicators of groundwater present |
| 2 | N | | Location near a groundwater divide or a headwater wetland |
| 3 | Y | | Wetland remains saturated for an extended time period with no additional water inputs |
| 4 | Y* | | Wetland soils are organic |
| 5 | N* | | Wetland is within a wellhead protection area |

Section 1 Comments (Refer to Section 1 numbers)

| |
|---------------------------------------------------------------------------------------------------------------------------------|
| *see comment below |
| |
| HU 6. TES species onsite include blue-winged teal; wetlands likely provide or support additional TES species habitat functions. |
| HU 7. Archaeological resources documented in concurrent study. |
| WH 7. SGCN/Priority Species onsite, e.g., blue-winged teal, kingfisher, tufted titmouse |
| WH 12. Hardwood Swamp is relatively infrequent within surrounding agricultural and urban context. |
| WQ 6. Dense reed canary grass may indicate excess nutrient inputs from upstream sources; but no excess algae/macrophytes. |
| WQ 7. Upstream inputs into Black River include surface runoff from agricultural and residential areas; but not primary source. |
| GW 1. Indicators of groundwater include vegetation, saturation at or near the surface, and shallow water table. |
| GW 4. Wetland soils include organic and mineral components. |
| GW 5. Sheboygan Water Utilities use Lake Michigan as source. |

Wildlife Habitat and Species Observation (including amphibians and reptiles)

List: direct observation, tracks, scat, other sign; type of habitat: nesting, migratory, winter, etc.

| Observed | Potential | Species/Habitat/Comments |
|----------|-----------|----------------------------------------------------------------------------------------------|
| Y | | Spring peeper/hardwood swamp/vocalizations |
| N | Y | Pileated woodpecker/ pine plantation/visual |
| N | Y | Black-capped chickadee/ pine plantation/visual |
| Y | | Wood frog/hardwood swamp, pine plantation/visual |
| N | Y | Common garter snake/ pine plantation/visual |
| N | Y | Blue jay/pine plantation/visual |
| N | Y | Northern long-eared bat/mature tree canopy with nearby water |
| N | Y | Red-shouldered hawk/hardwood swamp |
| Y | | Blue-winged teal/Black River channel/visual |
| Y | | Snapping turtle/Black River channel/visual |
| Y | | White tailed deer/wetland and upland, various habitat types/visual, tracks, browse |
| N | Y | Bald eagle/near water/ previous onsite observations |
| Y | | Blue-spotted Salamander/ vernal pools, hardwood swamp forested seep/visual, under logs |
| Y | | Eastern Red-backed Salamander/ vernal pools, hardwood swamp forested seep/visual, under logs |
| | | |
| | | |
| | | |
| | | |
| | | |

Fish and Aquatic Life Habitat and Species Observations

List: direct observation, other sign; type of habitat: nesting, spawning, nursery areas, etc.

| | | | | | Other (list below): |
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |

* L= Low, M = Medium, H = High

**Relative frequency of the impact in comparison to the general condition of wetlands and buffer areas in the region or watershed (C=Common, UC=Uncommon)

SUMMARY OF CONDITION ASSESSMENT (Include general description and comments)

| |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The hardwood swamp is generally in moderate to good condition, with the majority of stressors either absent or limited to the buffer. The most significant stressors appear to be siltation and excess nutrients from sources upstream in the Black R. and tributaries, and the cover of non-native species, primarily reed canary grass. Historic agricultural use within the buffer was probably limited to pasture, but current impacts are minimal. Recreational usage is limited to the unpaved trails that run through the State Park Portion of the area. |
| |
| |
| |
| |
| |

SUMMARY OF FUNCTIONAL VALUES (for both components unless otherwise noted)

| FUNCTION | SIGNIFICANCE | | | | |
|-------------------------------|--------------|--------|------|-------------|----|
| | Low | Medium | High | Exceptional | NA |
| Floristic Integrity | | | Y | | |
| Human Use Values | | Y | | | |
| Wildlife Habitat | | | Y | | |
| Fish and Aquatic Life Habitat | | | Y | | |
| Shoreline Protection | | | Y | | |
| Flood and Stormwater Storage | | | Y | | |
| Water Quality Protection | | | Y | | |
| Groundwater Processes | | | Y | | |

| FUNCTION | RATIONALE |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Floristic Integrity | The Hardwood Swamp has a high level of species diversity, presence of heterogeneous, adjacent plant communities, and presence of three vegetation strata. Highly conservative/rare plant species were lacking, and moderate to high levels of invasive species occur. |
| Human Use Values | Public access to the State Park portion of the site provides substantial value for recreation, hiking, and education, and archaeological resources on the site have historical significance. While there are trails through the wetland areas, they are probably underused by the public compared with the beach and dune areas. |
| Wildlife Habitat | The diversity of contiguous upland and wetland plant communities in a large, unfragmented block of habitat adds significance to the site's value for wildlife. A number of species were observed, are known to occur, or could occur onsite, including rare, protected, SGCN, and Priority Species, e.g. blue-winged teal. |
| Fish and Aquatic Life Habitat | The Black River and surrounding wetland and upland plant communities provide significant habitat for fish and aquatic life. The river and its tributaries have been impacted by agricultural and stormwater runoff, but retain a healthy aquatic plant community that is likely to support fish, waterfowl, and amphibians. |
| Shoreline Protection | The hardwood swamp provides vegetative cover along the banks of the Black River, offering shoreline protection, which has a significant positive effect for the river and downstream communities. |
| Flood and Stormwater Storage | The hardwood swamp within the Black River floodplain and surrounding areas provide significant value in storing floodwater and attenuating peak flows in the river, which may have a positive impact on reducing flooding downstream. |
| Water Quality Protection | The hardwood swamp surrounding the Black River provides significant value in protecting water quality within the Black River and Lake Michigan. Water quality in the Black River and its tributaries has been negatively impacted by runoff from residential and agricultural areas upstream. |
| Groundwater Processes | The hardwood swamp retains important groundwater function, including recharge and discharge, which has beneficial effects on surface and groundwater quality. Surface water inputs are probably significant during peak flows on the Black River, but groundwater is the primary source of hydrology year-round. |

Section 4: Project Impact Assessment

Brief Project Description

The proposed project consists of a golf course on a 247-acre parcel adjacent to Lake Michigan, with an access road to the west, crossing a DNR-owned 135-acre parcel, and the Black River.

Expected Project Impacts (significance for both components unless otherwise noted)

| IMPACT: describe (+ or -) | Permanence/Reversibility | Significance (Low, Medium, High) |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| Direct Impacts Road fill and construction of infrastructure is expected to directly impact wetland resulting in a permanent wetland loss. | Loss of wetland is expected to be permanent. | High |
| Secondary Impacts (including impacts which are indirectly attributable to the project) Road construction may alter wetland hydrology; increased runoff/nutrient loading; resulting in degradation of wetland habitats and water quality; wells may result in drawdown of water table. | Alterations to wetland hydrology, habitat, water quality, and water table are likely to be permanent. | High |
| Cumulative Impacts Additional development beyond the current proposed plan has the potential to impact additional wetlands. | Additional wetland loss would be permanent. | High |
| Spatial/Habitat Integrity Proposed project may result in fragmentation of habitat blocks. | Habitat fragmentation is expected to be permanent. | High |
| Rare Plant/Animal Communities/ Natural Areas Construction of golf course infrastructure may result in loss or degradation of rare plant communities including Great Lakes Ridge and Swale and interdunal wetland. | Loss of rare plant communities is expected to be permanent and irreversible; some species are likely to be supported by Hardwood Swamp. | Medium |

| 5 | N* | | Wetland is within a wellhead protection area |

SUMMARY OF FUNCTIONAL VALUES

| FUNCTION | SIGNIFICANCE | | | | |
|-------------------------------|--------------|--------|------|-------------|----|
| | Low | Medium | High | Exceptional | NA |
| Floristic Integrity | Y | | | | |
| Human Use Values | | Y | | | |
| Wildlife Habitat | | Y | | | |
| Fish and Aquatic Life Habitat | Y | | | | |
| Shoreline Protection | Y | | | | |
| Flood and Stormwater Storage | | Y | | | |
| Water Quality Protection | | Y | | | |
| Groundwater Processes | | Y | | | |

| FUNCTION | RATIONALE |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Floristic Integrity | There is a low level of floristic diversity, and vegetation is primarily early successional with an open tree canopy and dense shrub layer. Highly conservative/rare plant species were lacking, and high levels of invasive species dominate the community. |
| Human Use Values | Public access to the State Park property allows for recreation, hiking. While there are trails through the wetland areas, the degraded hardwood swamp offers limited recreational potential. |
| Wildlife Habitat | The combination of a diversity of contiguous upland and wetland plant communities in a large, unfragmented block of habitat adds significance to the site's value for wildlife. The presence of tree and shrub canopy provides suitable habitat for a variety of woodland bird and mammal species. |
| Fish and Aquatic Life Habitat | The Black River and surrounding wetland and upland plant communities provide significant habitat for fish and aquatic life. Tributary stream adjacent to this community has been impacted by stormwater runoff, and provides low quality aquatic habitat. |
| Shoreline Protection | The wetlands adjacent to the Black River tributary provide relatively consistent vegetative cover along the banks, offering limited shoreline protection and erosion control along a small section of bank, which has a positive effect for the river and downstream communities. |
| Flood and Stormwater Storage | The degraded hardwood swamp adjacent to the Black River tributary and in depressions west of the river offer limited value in storing and attenuating peak flows in the river, which may have a small positive impact on reducing flooding downstream. |
| Water Quality Protection | The degraded hardwood swamps adjacent to the Black River tributary and in depressions west of the river provide limited function in protecting water quality by allowing infiltration and absorbing runoff. Water quality in the Black River and its tributaries has been negatively impacted by runoff from residential and agricultural areas upstream. |
| Groundwater Processes | The degraded hardwood swamp retains groundwater functions, including groundwater recharge and discharge, which have beneficial effects on surface and groundwater quality. However, historical agricultural use and drainage may have altered groundwater processes in the depressions west of the river. |

Section 4: Project Impact Assessment

Brief Project Description

The proposed project consists of a golf course on a 247-acre parcel adjacent to Lake Michigan, with an access road to the west, crossing a DNR-owned 135-acre parcel, and the Black River.

Expected Project Impacts

| IMPACT: describe (+ or -) | Permanence/Reversibility | Significance (Low, Medium, High) |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|-----------------------------------------|
| Direct Impacts Road fill and construction of infrastructure is expected to directly impact wetland resulting in a permanent wetland loss. | Loss of wetland is expected to be permanent. | Medium |
| Secondary Impacts (including impacts which are indirectly attributable to the project) Road construction may alter wetland hydrology; increased runoff/nutrient loading; resulting in degradation of wetland habitats and water quality; wells may result in drawdown of water table. | Alterations to wetland hydrology, habitat, water quality, and water table are likely to be permanent. | Medium |
| Cumulative Impacts Additional development beyond the current proposed plan has the potential to impact additional wetlands. | Additional wetland loss would be permanent. | |
| Spatial/Habitat Integrity Proposed project may result in fragmentation of habitat blocks. | Habitat fragmentation would be permanent. | Medium |
| Rare Plant/Animal Communities/ Natural Areas No rare Plant/Animal Communities were identified in the degraded Hardwood Swamp, and habitat value of the community is likely limited. | Loss of rare plant communities is not expected to occur within the degraded hardwood swamp community type. | Low |

**Relative frequency of the impact in comparison to the general condition of wetlands and buffer areas in the region or watershed (C=Common, UC=Uncommon)

SUMMARY OF CONDITION ASSESSMENT (Include general description and comments)

| |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The forested seep is generally intact, with the majority of stressors either absent or limited to the buffer. |
| The most significant stressors appear to be the cover of non-native species, primarily barberry, and excessive deer browse. |
| Recreational usage is limited to the unpaved trails that run through the State Park Portion of the area. |
| The forested seep has relatively minimal human disturbance. The tree canopy consists of a diverse mix of species. Natural disturbances, especially windthrow, have led to development of a complex microtopography of cradles and knolls. |
| This provides increased microhabitat diversity, which is important to regeneration of yellow birch, and provides ideal habitat for salamanders. |
| |
| |
| |

SUMMARY OF FUNCTIONAL VALUES (for both components unless otherwise noted)

| FUNCTION | SIGNIFICANCE | | | | |
|-------------------------------|--------------|--------|------|-------------|----|
| | Low | Medium | High | Exceptional | NA |
| Floristic Integrity | | | Y | | |
| Human Use Values | | | Y | | |
| Wildlife Habitat | | | Y | | |
| Fish and Aquatic Life Habitat | | | Y | | |
| Shoreline Protection | | | Y | | |
| Flood and Stormwater Storage | | Y | | | |
| Water Quality Protection | | | Y | | |
| Groundwater Processes | | | Y | | |

| FUNCTION | RATIONALE |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Floristic Integrity | The forested seep has a high diversity of canopy and groundlayer species, and conservative species associated with groundwater discharge are represented. Invasives coverage is low. This community is part of an intact transition between adjacent hardwood swamp communities and northern mesic forest uplands. |
| Human Use Values | Public access to the State Park portion of the site provides opportunities for recreation, hiking, and education, and archaeological resources on the site have historical significance. |
| Wildlife Habitat | The diversity of contiguous upland and wetland plant communities in a large, unfragmented block of habitat adds significance to the site's value for wildlife. A number of species of fauna were observed, are known to occur, or could occur onsite, including rare, protected, SGCN, and Priority Species. The forested seep provides exceptional habitat for amphibians, especially salamanders. |
| Fish and Aquatic Life Habitat | The Black River and surrounding wetland and upland plant communities provide significant habitat for fish and aquatic life. The forested seep provides value to aquatic life that depends on high quality adjacent wetlands for habitat. |
| Shoreline Protection | The forested seep adjacent to the Black River provides essentially unbroken vegetative cover along the banks, offering shoreline protection. Forested Seep has limited extent adjacent to the Black River. |
| Flood and Stormwater Storage | The forested seep along the upslope edge of the Black River floodplain provides limited value in storing and attenuating peak flows in the river, given its small size and linear nature. |
| Water Quality Protection | The forested seep surrounding the Black River provides sustained groundwater discharge to the Black River, which helps protect and maintain water quality and volume to the Black River year round. |
| Groundwater Processes | The forested seep has retains essentially intact groundwater function, as evidenced by the presence of a zone of groundwater discharge, indicators of groundwater discharge such as skunk cabbage, and a lack of sediment and nutrient inputs. |

Section 4: Project Impact Assessment

Brief Project Description

The proposed project consists of a golf course on a 247-acre parcel adjacent to Lake Michigan, with an access road to the west, crossing a DNR-owned 135-acre parcel, and the Black River.

Expected Project Impacts (significance for both components unless otherwise noted)

| IMPACT: describe (+ or -) | Permanence/Reversibility | Significance (Low, Medium, High) |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|----------------------------------|
| Direct Impacts Road fill and construction of buildings, parking lots and infrastructure is expected to directly impact wetland resulting in a permanent wetland loss. | Loss of wetland is expected to be permanent. | High |
| Secondary Impacts (including impacts which are indirectly attributable to the project) Road construction may alter wetland hydrology; increased runoff/nutrient loading; resulting in degradation of wetland habitats and water quality; wells may result in drawdown of water table. | Alterations to wetland hydrology, habitat, water quality, and water table are likely to be permanent. | High |
| Cumulative Impacts Additional development beyond the current proposed plan has the potential to impact additional wetlands. | Additional wetland loss would be permanent. | |
| Spatial/Habitat Integrity Construction of roads, paths and fairways is expected to result in fragmentation of habitat blocks. | Habitat fragmentation is expected to be permanent. | High |
| Rare Plant/Animal Communities/ Natural Areas Construction of golf course infrastructure is expected to result in loss or degradation of rare plant communities including Great Lakes Ridge and Swale and interdunal wetland. | Loss of rare plant communities is expected to be permanent and irreversible. | High |

| 2 | Y | Y | Used for educational or scientific purposes |
| 3 | Y | | Visually or physically accessible to public |
| 4 | Y | | Aesthetically pleasing due to diversity of habitat types, lack of pollution or degradation |
| 5 | Y | | In or adjacent to RED FLAG areas List: Lake Michigan |
| 6 | Y* | | Supports or provides habitat for endangered, threatened or special concern species |
| 7 | Y* | | In or adjacent to archaeological or cultural resource site |
| WH | | | Wildlife Habitat |
| 1 | Y | | Wetland and contiguous habitat >10 acres |
| 2 | Y | | 3 or more strata present (>10% cover) |
| 3 | Y | | Within or adjacent to habitat corridor or established wildlife habitat area |
| 4 | Y | | 100 m buffer – natural land cover ≥50%(south) 75% (north) intact |
| 5 | Y | | Occurs in a Joint Venture priority township |
| 6 | Y | | Interspersion of habitat structure (hemi-marsh,shrub/emergent, wetland/upland complex,etc.) |
| 7 | Y* | | Supports or provides habitat for SGCN or birds listed in the WI All-Bird Cons. Plan, or other plans |
| 8 | Y | | Part of a large habitat block that supports area sensitive species |
| 9 | Y | | Ephemeral pond with water present ≥ 45 days |
| 10 | Y | | Standing water provides habitat for amphibians and aquatic invertebrates |
| 11 | N | | Seasonally exposed mudflats present |
| 12 | Y* | | Provides habitat scarce in the area (urban, agricultural, etc.) |
| FA | | | Fish and Aquatic Life Habitat |
| 1 | N | | Wetland is connected or contiguous with perennial stream or lake |
| 2 | Y | | Standing water provides habitat for amphibians and aquatic invertebrates |
| 3 | N | | Natural Heritage Inventory (NHI) listed aquatic species within aquatic system |
| 4 | Y | | Vegetation is inundated in spring |
| SP | | | Shoreline Protection |
| 1 | N | | Along shoreline of a stream, lake, pond or open water area (≥1 acre) - if no, not applicable |
| 2 | N | | Potential for erosion due to wind fetch, waves, heavy boat traffic, erosive soils, fluctuating water levels or high flows – if no, not applicable |
| 3 | Y | | Densely rooted emergent or woody vegetation |
| ST | | | Storm and Floodwater Storage |
| 1 | Y | | Basin wetland, constricted outlet, has through-flow <u>or</u> is adjacent to a stream |
| 2 | N* | | Water flow through wetland is NOT channelized |
| 3 | Y | | Dense, persistent vegetation |
| 4 | N | | Evidence of flashy hydrology |
| 5 | N | | Point or non-point source inflow |
| 6 | N | | Impervious surfaces cover >10% of land surface within the watershed |
| 7 | Y | | Within a watershed with ≤10% wetland |
| 8 | Y | | Potential to hold >10% of the runoff from contributing area from a 2-year 24-hour storm event |
| WQ | | | Water Quality Protection |
| 1 | N | | Provides substantial storage of storm and floodwater based on previous section |
| 2 | Y | | Basin wetland <u>or</u> constricted outlet |
| 3 | n/a | | Water flow through wetland is NOT channelized |
| 4 | N | | Vegetated wetland associated with a lake or stream |
| 5 | Y | | Dense, persistent vegetation |
| 6 | N | | Signs of excess nutrients, such as algae blooms, heavy macrophyte growth |
| 7 | N | | Stormwater or surface water from agricultural land is major hydrology source |
| 8 | N | | Discharge to surface water |
| 9 | N | | Natural land cover in 100m buffer area < 50% |
| GW | | | Groundwater Processes |
| 1 | Y* | | Springs, seeps or indicators of groundwater present |
| 2 | N | | Location near a groundwater divide or a headwater wetland |
| 3 | Y | | Wetland remains saturated for an extended time period with no additional water inputs |
| 4 | N | | Wetland soils are organic |
| 5 | N | | Wetland is within a wellhead protection area |

Section 1 Comments (Refer to Section 1 numbers)

| |
|-----------------------------------------------------------------------------------------------------------------|
| *see comment below |
| HU 1. Area is on private land, off limits to public. |
| HU 6. TES species occur within interdunal wetland and in adjacent dune habitat, including plants and animals. |
| HU 7. Archaeological resources documented in concurrent study. |
| WH 7. This community and adjacent dunes providing habitat for SGCN/Priority Species. |
| WH 12. Interdunal wetland is rare within the surrounding region. |
| GW 1. Indicators of groundwater include vegetation, saturation at or near the surface, and shallow water table. |
| ST 2. Interdunal wetlands are not connected to any surface water inflows/outflows. |
| |
| |
| |

Wildlife Habitat and Species Observation (including amphibians and reptiles)

List: direct observation, tracks, scat, other sign; type of habitat: nesting, migratory, winter, etc.

| Observed | Potential | Species/Habitat/Comments |
|----------|-----------|----------------------------------------------------------------------------------------------|
| N | Y | Spring peeper/hardwood swamp/vocalizations |

| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |

* L= Low, M = Medium, H = High

**Relative frequency of the impact in comparison to the general condition of wetlands and buffer areas in the region or watershed (C=Common, UC=Uncommon)

SUMMARY OF CONDITION ASSESSMENT (Include general description and comments)

| |
|-------------------------------------------------------------------------------------------------------------------------------------|
| Plant community integrity is in high to exceptional condition, with the majority of stressors either absent or of low severity. |
| The stressors that are present include limited cover of invasive species, invasion of brush, and the presence of a few foot trails. |
| Historic use for pasture or tree planting may have occurred within the interdunal wetland, but effects are limited. |
| Public access and recreational usage are limited. |
| These wetlands provide habitat for rare, sand dune dwelling plants and animals. |
| Interdunal wetlands are limited to a small acreage within the watershed, and are rare within the region. |
| |
| |
| |

SUMMARY OF FUNCTIONAL VALUES

| FUNCTION | SIGNIFICANCE | | | | |
|-------------------------------|--------------|--------|------|-------------|----|
| | Low | Medium | High | Exceptional | NA |
| Floristic Integrity | | | | Y | |
| Human Use Values | | Y | | | |
| Wildlife Habitat | | | | Y | |
| Fish and Aquatic Life Habitat | | | | | Y |
| Shoreline Protection | | | | | Y |
| Flood and Stormwater Storage | | | | | Y |
| Water Quality Protection | | Y | Y | | |
| Groundwater Processes | | | Y | | |

| FUNCTION | RATIONALE |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Floristic Integrity | There is a moderate level of species diversity, presence of heterogeneous, adjacent plant communities, and presence of from one to three vegetation strata. Highly conservative/rare plant species are present, and low levels of invasive species occur within the community. This is a rare plant community in Wisconsin. |
| Human Use Values | This area is not open to the public, limiting usage for recreation, hiking, and education. Archaeological resources onsite have historical significance. TES species occur onsite. |
| Wildlife Habitat | The Interdunal Wetland provides unique habitats that are likely important to dune-dwelling wildlife. A number of species of fauna were observed, are known to occur, or could potentially occur onsite, including some rare, protected, SGCN, and Priority Species. |
| Fish and Aquatic Life Habitat | Because of their isolated and seasonal nature, the interdunal wetlands probably do not provide significant habitat for fish and aquatic life, however they may serve as a breeding ground for amphibians. |
| Shoreline Protection | Because they are isolated from perennial bodies of water, the interdunal wetlands do not offer significant shoreline protection value. |
| Flood and Stormwater Storage | Because they are isolated from perennial bodies of water, and their direct watershed is small, the interdunal wetlands do not offer significant flood and stormwater storage value. |
| Water Quality Protection | Because they are isolated from other surface waters, the wetlands provide limited value to protecting water quality within the local watershed. |
| Groundwater Processes | The interdunal wetlands are dependent on watertable fluctuation, and retain intact groundwater processes, including groundwater recharge and discharge, which has important beneficial effects on local surface and groundwater quality for adjacent habitats. |

Section 4: Project Impact Assessment

Brief Project Description

The proposed project consists of a golf course on a 247-acre parcel adjacent to Lake Michigan, with an access road to the west, crossing a DNR-owned 135-acre parcel, and the Black River.

Expected Project Impacts

| IMPACT: describe (+ or -) | Permanence/Reversibility | Significance (Low, Medium, High) |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|-----------------------------------------|
| Direct Impacts Road fill and construction of buildings, parking lots and infrastructure is expected to directly impact wetlands resulting in a permanent wetland loss. | Loss of wetland is expected to be permanent. | High |
| Secondary Impacts (including impacts which are indirectly attributable to the project) Road construction is expected to alter wetland hydrology; increased runoff/nutrient loading are expected to result in degradation of wetland habitats and water quality; wells may result in drawdown of water table. | Alterations to wetland hydrology, habitat, water quality, and water table are likely to be permanent. | High |
| Cumulative Impacts Additional development beyond the current proposed plan has the potential to impact additional wetlands. | Additional wetland loss would be permanent. | |
| Spatial/Habitat Integrity Construction of roads, paths and fairways is expected to result in fragmentation of habitat blocks. | Habitat fragmentation is expected to be permanent. | High |
| Rare Plant/Animal Communities/ Natural Areas Construction of golf course infrastructure is expected to result in loss or degradation of rare plant communities including Great Lakes Ridge and Swale and interdunal wetland. | Loss of rare plant communities is expected to be permanent and irreversible. | High |

**Kohler Golf Course
Sheboygan County, Wisconsin**

2014 Species List - Interdunal Wetland

| Scientific Name | Common Name | Native | Physiognomy | Coefficient of Conservatism | Region 3 Wetland Coefficient |
|--------------------------------------------------------|------------------------------|------------|-------------|-----------------------------|------------------------------|
| <i>Asclepias syriaca</i> | common milkweed | native | forb | 1 | 5 |

**Relative frequency of the impact in comparison to the general condition of wetlands and buffer areas in the region or watershed (C=Common, UC=Uncommon)

SUMMARY OF CONDITION ASSESSMENT (Include general description and comments)

| |
|----------------------------------------------------------------------------------------------------------------------------------------------------|
| The Swale Wetland complex is generally in moderate to intact condition, with the majority of stressors either absent or historic. |
| The most significant stressors appear to be the presence of invasive reed canary grass, and possibly deer herbivory. |
| Historic agricultural was limited, probably including pasturing. |
| Recreational usage is limited to the unpaved trails through the area, and the area is not open to the public |
| These wetlands likely provide important habitat for a variety of amphibians that rely on seasonal ponding and proximity to adjacent upland forest. |
| |
| |
| |
| |

SUMMARY OF FUNCTIONAL VALUES

| FUNCTION | SIGNIFICANCE | | | | |
|-------------------------------|--------------|--------|------|-------------|----|
| | Low | Medium | High | Exceptional | NA |
| Floristic Integrity | | | Y | | |
| Human Use Values | | Y | | | |
| Wildlife Habitat | | | | Y | |
| Fish and Aquatic Life Habitat | | | | | Y |
| Shoreline Protection | | | | | Y |
| Flood and Stormwater Storage | | | | | Y |
| Water Quality Protection | | Y | | | |
| Groundwater Processes | | | Y | | |

| FUNCTION | RATIONALE |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Floristic Integrity | The swale wetland has a moderate level of species diversity, presence of heterogeneous, adjacent plant communities, and presence of from one to three vegetation strata. Highly conservative/rare plant species were lacking, and low to moderate levels of invasive species occur onsite. |
| Human Use Values | Public access to the Kohler portion of the site is limited, limiting usage for recreation, hiking, and education. Archaeological resources on the site have historical significance. |
| Wildlife Habitat | The combination of contiguous upland and wetland plant communities in a large, unfragmented block of habitat adds significance to the site's value for wildlife. A number of species of fauna were observed, are known to occur, or could potentially occur onsite, including some rare, protected, SGCN, and Priority Species. |
| Fish and Aquatic Life Habitat | Because of their isolated and seasonal nature, the swale wetlands probably do not have significant habitat for fish and aquatic life; however they are an important breeding ground for amphibians. |
| Shoreline Protection | Because they are isolated from perennial bodies of water, the swale wetlands do not offer significant shoreline protection value. |
| Flood and Stormwater Storage | Because they are isolated from other surface waters, and their direct watershed is small, the swale wetlands do not offer significant flood and stormwater storage value. |
| Water Quality Protection | Because they are isolated from other surface waters, the swale wetlands provide limited value to protecting water quality within the local watershed. |
| Groundwater Processes | The swale wetlands retain intact groundwater processes, including groundwater recharge and discharge, which has beneficial effects on local surface and groundwater quality within adjacent habitats. |

Section 4: Project Impact Assessment

Brief Project Description

The proposed project consists of a golf course on a 247-acre parcel adjacent to Lake Michigan, with an access road to the west, crossing a DNR-owned 135-acre parcel, and the Black River.

Expected Project Impacts

| IMPACT: describe (+ or -) | Permanence/Reversibility | Significance (Low, Medium, High) |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|-----------------------------------------|
| Direct Impacts Road fill and construction of buildings, parking lots and infrastructure is expected to directly impact wetland resulting in a permanent wetland loss. | Loss of wetland is expected to be permanent. | High |
| Secondary Impacts (including impacts which are indirectly attributable to the project) Road construction is expected to alter wetland hydrology; increased runoff/nutrient loading are expected to result in degradation of wetland habitats and water quality; wells may result in drawdown of water table. | Alterations to wetland hydrology, habitat, water quality, and water table are likely to be permanent. | High |
| Cumulative Impacts Additional development beyond the current proposed plan has the potential to impact additional wetlands. | Additional wetland loss would be permanent. | |
| Spatial/Habitat Integrity Construction of roads, paths and fairways is expected to result in fragmentation of habitat blocks. | Habitat fragmentation is expected to be permanent. | High |
| Rare Plant/Animal Communities/ Natural Areas Construction of golf course infrastructure is expected to result in loss or degradation of rare plant communities including Great Lakes Ridge and Swale and interdunal wetland. | Loss of rare plant communities is expected to be permanent and irreversible. | High |

SECTION 1: Functional Value Assessment

| HU | Y/N | Potential | Human Use Values: recreation, culture, education, science, natural scenic beauty |
|----|-----|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Y | | Used for recreation (hunting, birding, hiking, etc.). List: hunting, birding, hiking; state park uses |
| 2 | Y | | Used for educational or scientific purposes |
| 3 | Y | | Visually or physically accessible to public |
| 4 | Y | | Aesthetically pleasing due to diversity of habitat types, lack of pollution or degradation |
| 5 | Y | | In or adjacent to RED FLAG areas List: State park; Lake Michigan |
| 6 | Y* | | Supports or provides habitat for endangered, threatened or special concern species |
| 7 | Y* | | In or adjacent to archaeological or cultural resource site |
| WH | | | Wildlife Habitat |
| 1 | Y | | Wetland and contiguous habitat >10 acres |
| 2 | Y | | 3 or more strata present (>10% cover) |
| 3 | Y | | Within or adjacent to habitat corridor or established wildlife habitat area |
| 4 | Y | | 100 m buffer – natural land cover ≥50%(south) 75% (north) intact |
| 5 | Y | | Occurs in a Joint Venture priority township |
| 6 | Y | | Interspersion of habitat structure (hemi-marsh,shrub/emergent, wetland/upland complex,etc.) |
| 7 | Y* | | Supports or provides habitat for SGCN or birds listed in the WI All-Bird Cons. Plan, or other plans |
| 8 | Y | | Part of a large habitat block that supports area sensitive species |
| 9 | Y | | Ephemeral pond with water present ≥ 45 days |
| 10 | Y | | Standing water provides habitat for amphibians and aquatic invertebrates |
| 11 | N | | Seasonally exposed mudflats present |
| 12 | Y* | | Provides habitat scarce in the area (urban, agricultural, etc.) |
| FA | | | Fish and Aquatic Life Habitat |
| 1 | Y | | Wetland is connected or contiguous with perennial stream or lake |
| 2 | Y | | Standing water provides habitat for amphibians and aquatic invertebrates |
| 3 | N | Y | Natural Heritage Inventory (NHI) listed aquatic species within aquatic system |
| 4 | Y | | Vegetation is inundated in spring |
| SP | | | Shoreline Protection |
| 1 | Y | | Along shoreline of a stream, lake, pond or open water area (≥1 acre) - if no, not applicable |
| 2 | N | | Potential for erosion due to wind fetch, waves, heavy boat traffic, erosive soils, fluctuating water levels or high flows – if no, not applicable |
| 3 | Y | | Densely rooted emergent or woody vegetation |
| ST | | | Storm and Floodwater Storage |
| 1 | Y | | Basin wetland, constricted outlet, has through-flow <u>or</u> is adjacent to a stream |
| 2 | Y | | Water flow through wetland is NOT channelized |
| 3 | Y | | Dense, persistent vegetation |
| 4 | N | | Evidence of flashy hydrology |
| 5 | Y | | Point or non-point source inflow |
| 6 | Y | | Impervious surfaces cover >10% of land surface within the watershed |
| 7 | Y | | Within a watershed with ≤10% wetland |
| 8 | Y | | Potential to hold >10% of the runoff from contributing area from a 2-year 24-hour storm event |
| WQ | | | Water Quality Protection |
| 1 | Y | | Provides substantial storage of storm and floodwater based on previous section |
| 2 | Y | | Basin wetland <u>or</u> constricted outlet |
| 3 | Y | | Water flow through wetland is NOT channelized |
| 4 | Y | | Vegetated wetland associated with a lake or stream |
| 5 | Y | | Dense, persistent vegetation |
| 6 | N | | Signs of excess nutrients, such as algae blooms, heavy macrophyte growth |
| 7 | N | | Stormwater or surface water from agricultural land is major hydrology source |
| 8 | Y | | Discharge to surface water |
| 9 | Y | | Natural land cover in 100m buffer area < 50% |
| GW | | | Groundwater Processes |
| 1 | Y* | | Springs, seeps or indicators of groundwater present |
| 2 | N | | Location near a groundwater divide or a headwater wetland |
| 3 | Y | | Wetland remains saturated for an extended time period with no additional water inputs |
| 4 | Y* | | Wetland soils are organic |
| 5 | N | | Wetland is within a wellhead protection area |

Section 1 Comments (Refer to Section 1 numbers)

| |
|---------------------------------------------------------------------------------------------------------------------------|
| *see comment below |
| |
| HU 6. TES species observed onsite include blue-winged teal; wet meadow provides or supports TES species habitat. |
| HU 7. Archaeological resources documented in concurrent study. |
| WH 7. SGCN/Priority Species: blue-winged teal |
| WH 12. Wet Meadow is uncommon within surrounding agricultural and urban context. |
| |
| GW 1. Indicators of groundwater discharge include vegetation, saturation at or near the surface, and shallow water table. |
| GW 4. Wetland soils include organic and mineral components. |
| |
| |

SUMMARY OF FUNCTIONAL VALUES

| FUNCTION | SIGNIFICANCE | | | | |
|-------------------------------|--------------|--------|------|-------------|----|
| | Low | Medium | High | Exceptional | NA |
| Floristic Integrity | | | Y | | |
| Human Use Values | | Y | | | |
| Wildlife Habitat | | | Y | | |
| Fish and Aquatic Life Habitat | | | Y | | |
| Shoreline Protection | | | Y | | |
| Flood and Stormwater Storage | | | Y | | |
| Water Quality Protection | | | Y | | |
| Groundwater Processes | | | Y | | |

| FUNCTION | RATIONALE |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Floristic Integrity | The intact wet meadow has a high level of species diversity, and a general lack of invasive species coverage. Conservative species are present, indicating an undisturbed, intact plant community. No rare plant species were identified. |
| Human Use Values | Public access to the wet meadow on State Park land is limited to off trail access by foot. Values for recreation, hiking, and education are limited due to the difficulty of access. Archaeological resources elsewhere on the site have historical significance. |
| Wildlife Habitat | The combination of a diversity of contiguous upland and wetland plant communities in a large, unfragmented block of habitat adds significance to the site's value for wildlife. A number of species of fauna were observed, are known to occur, or could potentially occur onsite, including some rare, protected, SGCN, and Priority Species, e.g., blue-winged teal. |
| Fish and Aquatic Life Habitat | The Black River and surrounding wetland and upland plant communities provide significant habitat for fish and aquatic life. The river and its tributaries have been somewhat impacted by agricultural and stormwater runoff, but retain a healthy aquatic plant community and provides habitat for fish, waterfowl, and amphibians. |
| Shoreline Protection | The wet/sedge meadow provides vegetative cover along the banks of the Black River, offering shoreline protection, which has a positive effect for the river and downstream communities. |
| Flood and Stormwater Storage | The wetlands within the Black River floodplain and surrounding areas upslope provide significant value in storing and attenuating peak flows in the river, which may have a positive impact on reducing flooding downstream. |
| Water Quality Protection | The wetlands surrounding the Black River provide significant value to protecting water quality within the Black River and Lake Michigan. Water quality in the Black River and its tributaries has been negatively impacted by runoff from residential and agricultural areas upstream. |
| Groundwater Processes | The wet/sedge meadow occurs on microsites with essentially intact groundwater processes, including active groundwater discharge areas, which has beneficial effects on surface and groundwater quality, and is important to maintaining the integrity of the native plant community. |

Section 4: Project Impact Assessment

Brief Project Description

The proposed project consists of a golf course on a 247-acre parcel adjacent to Lake Michigan, with an access road to the west, crossing a DNR-owned 135-acre parcel, and the Black River.

Expected Project Impacts

| IMPACT: describe (+ or -) | Permanence/Reversibility | Significance (Low, Medium, High) |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|
| Direct Impacts Road fill and construction of buildings, parking lots and infrastructure is expected to directly impact wetland resulting in a permanent wetland loss. | Loss of wetland is expected to be permanent. | High |
| Secondary Impacts (including impacts which are indirectly attributable to the project) Road construction is expected to alter wetland hydrology; increased runoff/nutrient loading are expected to result in degradation of wetland habitats and water quality; wells may result in drawdown of water table. | Alterations to wetland hydrology, habitat, water quality, and water table are likely to be permanent. | High |
| Cumulative Impacts Additional development beyond the current proposed plan has the potential to impact additional wetlands. | Additional wetland loss would be permanent. | |
| Spatial/Habitat Integrity Construction of roads is expected to result in fragmentation of habitat blocks. | Habitat fragmentation is expected to be permanent. | High |
| Rare Plant/Animal Communities/ Natural Areas Construction of golf course infrastructure is expected to result in loss or degradation of plant communities and rare species habitats. | Loss of rare plants/animals and communities is expected to be permanent and irreversible. Impacted species within the wet meadow include blue-winged teal. | Medium |

SECTION 1: Functional Value Assessment

| HU | Y/N | Potential | Human Use Values: recreation, culture, education, science, natural scenic beauty |
|----|-----|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Y | | Used for recreation (hunting, birding, hiking, etc.). List: hunting, birding, hiking; state park uses |
| 2 | Y | | Used for educational or scientific purposes |
| 3 | Y | | Visually or physically accessible to public |
| 4 | Y | | Aesthetically pleasing due to diversity of habitat types, lack of pollution or degradation |
| 5 | Y | | In or adjacent to RED FLAG areas List: State park; Lake Michigan |
| 6 | Y* | | Supports or provides habitat for endangered, threatened or special concern species |
| 7 | Y* | | In or adjacent to archaeological or cultural resource site |
| WH | | | Wildlife Habitat |
| 1 | Y | | Wetland and contiguous habitat >10 acres |
| 2 | Y | | 3 or more strata present (>10% cover) |
| 3 | Y | | Within or adjacent to habitat corridor or established wildlife habitat area |
| 4 | Y | | 100 m buffer – natural land cover ≥50%(south) 75% (north) intact |
| 5 | Y | | Occurs in a Joint Venture priority township |
| 6 | Y | | Interspersion of habitat structure (hemi-marsh,shrub/emergent, wetland/upland complex,etc.) |
| 7 | Y* | | Supports or provides habitat for SGCN or birds listed in the WI All-Bird Cons. Plan, or other plans |
| 8 | Y | | Part of a large habitat block that supports area sensitive species |
| 9 | Y | | Ephemeral pond with water present > 45 days |
| 10 | Y | | Standing water provides habitat for amphibians and aquatic invertebrates |
| 11 | N | | Seasonally exposed mudflats present |
| 12 | Y* | | Provides habitat scarce in the area (urban, agricultural, etc.) |
| FA | | | Fish and Aquatic Life Habitat |
| 1 | Y | | Wetland is connected or contiguous with perennial stream or lake |
| 2 | Y | | Standing water provides habitat for amphibians and aquatic invertebrates |
| 3 | N | Y | Natural Heritage Inventory (NHI) listed aquatic species within aquatic system |
| 4 | Y | | Vegetation is inundated in spring |
| SP | | | Shoreline Protection |
| 1 | Y | | Along shoreline of a stream, lake, pond or open water area (≥1 acre) - if no, not applicable |
| 2 | N | | Potential for erosion due to wind fetch, waves, heavy boat traffic, erosive soils, fluctuating water levels or high flows – if no, not applicable |
| 3 | Y | | Densely rooted emergent or woody vegetation |
| ST | | | Storm and Floodwater Storage |
| 1 | Y | | Basin wetland, constricted outlet, has through-flow <u>or</u> is adjacent to a stream |
| 2 | Y | | Water flow through wetland is NOT channelized |
| 3 | Y | | Dense, persistent vegetation |
| 4 | N | | Evidence of flashy hydrology |
| 5 | Y | | Point or non-point source inflow |
| 6 | Y | | Impervious surfaces cover >10% of land surface within the watershed |
| 7 | Y | | Within a watershed with ≤10% wetland |
| 8 | Y | | Potential to hold >10% of the runoff from contributing area from a 2-year 24-hour storm event |
| WQ | | | Water Quality Protection |
| 1 | Y | | Provides substantial storage of storm and floodwater based on previous section |
| 2 | Y | | Basin wetland <u>or</u> constricted outlet |
| 3 | Y | | Water flow through wetland is NOT channelized |
| 4 | Y | | Vegetated wetland associated with a lake or stream |
| 5 | Y | | Dense, persistent vegetation |
| 6 | Y* | | Signs of excess nutrients, such as algae blooms, heavy macrophyte growth |
| 7 | Y* | | Stormwater or surface water from agricultural land is major hydrology source |
| 8 | Y | | Discharge to surface water |
| 9 | N | | Natural land cover in 100m buffer area < 50% |
| GW | | | Groundwater Processes |
| 1 | Y* | | Springs, seeps or indicators of groundwater present |
| 2 | N | | Location near a groundwater divide or a headwater wetland |
| 3 | Y | | Wetland remains saturated for an extended time period with no additional water inputs |
| 4 | Y* | | Wetland soils are organic |
| 5 | N* | | Wetland is within a wellhead protection area |

Section 1 Comments (Refer to Section 1 numbers)

| |
|---------------------------------------------------------------------------------------------------------------------------|
| *see comment below |
| |
| HU 6. TES species observed onsite include blue-winged teal; wet meadow provides or supports TES species habitat. |
| HU 7. Archaeological resources documented in concurrent study. |
| WH 7. SGCN/Priority Species: blue-winged teal |
| WH 12. Wet meadow-degraded is relatively infrequent within surrounding agricultural and urban context. |
| WQ 6. Dense reed canary grass may indicate excess nutrient inputs from upstream sources; but no excess algae/macrophytes. |
| WQ 7. Upstream inputs into Black River include surface runoff from agricultural and residential areas. |
| GW 1. Indicators of groundwater discharge include vegetation, saturation at or near the surface, and shallow water table. |
| GW 4. Wetland soils include organic and mineral components. |
| GW 5. Sheboygan Water Utilities use Lake Michigan as source. |

Wildlife Habitat and Species Observation (including amphibians and reptiles)

List: direct observation, tracks, scat, other sign; **type of habitat:** nesting, migratory, winter, etc.

| Observed | Potential | Species/Habitat/Comments |
|----------|-----------|-------------------------------------------------------------------------------|
| Y | | Spring peeper/hardwood swamp/vocalizations |
| | | |
| N | Y | other amphibians |
| N | Y | Common garter snake/ pine plantation/visual |
| | | |
| N | Y | Common yellowthroat/wet meadow |
| N | Y | Red-shouldered hawk/hardwood swamp |
| Y | | Blue-winged teal/Black River channel/visual |
| Y | | Snapping turtle/Black River channel/visual |
| Y | | White tailed deer/wetland and upland, various habitats/visual, tracks, browse |
| N | Y | Bald eagle/near water/ previous onsite observations |

| N | N | N | n/a | n/a | Golf course |
| N | N | N | n/a | n/a | Gravel pit |
| Y | Y | Y | M | C | Recreational use (boating, ATVs, etc.) |
| N | N | N | n/a | n/a | Excavation or soil grading |
| | | | | | Other (list below): |
| | | | | | |
| | | | | | |
| | | | | | |
| | | | | | |

* L= Low, M = Medium, H = High

**Relative frequency of the impact in comparison to the general condition of wetlands and buffer areas in the region or watershed (C=Common, UC=Uncommon)

SUMMARY OF CONDITION ASSESSMENT (Include general description and comments)

The degraded wet meadow has been impacted by invasion of reed canary grass, which is the result of other stressors including increased runoff, sedimentation, and nutrient inputs from agricultural and residential land uses upstream. Floristic diversity remains moderate, however reed canary grass is dominant over much of the community. Historic agricultural use probably consisted of limited grazing. Recreational usage is limited, and there is a lack of easy foot access to these areas.

SUMMARY OF FUNCTIONAL VALUES

| FUNCTION | SIGNIFICANCE | | | | |
|-------------------------------|--------------|--------|------|-------------|----|
| | Low | Medium | High | Exceptional | NA |
| Floristic Integrity | Y | | | | |
| Human Use Values | | Y | | | |
| Wildlife Habitat | | Y | | | |
| Fish and Aquatic Life Habitat | | | Y | | |
| Shoreline Protection | | | Y | | |
| Flood and Stormwater Storage | | | Y | | |
| Water Quality Protection | | Y | | | |
| Groundwater Processes | | Y | | | |

| FUNCTION | RATIONALE |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Floristic Integrity | The degraded wet meadow has moderate species diversity, but high dominance by invasive reed canary grass. Conservative species are absent, and no rare plant species were identified. |
| Human Use Values | Public access to the disturbed wet meadow on State Park land is limited, and its value for recreation, hiking, and education are low. Archaeological resources elsewhere on the site have historical significance. |
| Wildlife Habitat | The combination of a diversity of contiguous upland and wetland plant communities in a large, unfragmented block of habitat adds significance to the site's value for wildlife. A number of species of fauna were observed, are known to occur, or could potentially occur onsite, including some rare, protected, SGCN, and Priority Species, e.g., blue-winged teal. |
| Fish and Aquatic Life Habitat | The Black River and adjacent wet meadow and upland plant communities provide significant habitat for fish and aquatic life. The river and its tributaries have been somewhat impacted by agricultural and stormwater runoff, but retain a healthy aquatic plant community and provide breeding habitat for amphibians. |
| Shoreline Protection | The disturbed wet meadow forms a large extent directly adjacent to the Black River, where it provides dense and unbroken vegetative cover along the banks, offering shoreline protection, which has a positive effect for the river and downstream communities. |
| Flood and Stormwater Storage | The disturbed wet meadow within the Black River floodplain and surrounding areas provides significant capacity to store floodwater and attenuate peak flows in the river, because it occurs on a flat surface only slightly elevated above the river channel. The meadow's storage capacity may have a positive impact on reducing flooding downstream. |
| Water Quality Protection | The wetlands surrounding the Black River provide significant value to protecting water quality within the Black River and Lake Michigan. Water quality in the Black River and its tributaries has been negatively impacted by runoff from residential and agricultural areas upstream. |
| Groundwater Processes | The degraded wet meadow occurs on areas where surface water inputs may have a greater magnitude than groundwater inputs, though a seasonally high water table is apparent. Groundwater quality may benefit from recharge and filtering of excess nutrients in these areas. |

Section 4: Project Impact Assessment

Brief Project Description

The proposed project consists of a golf course on a 247-acre parcel adjacent to Lake Michigan, with an access road to the west, crossing a DNR-owned 135-acre parcel, and the Black River.

Expected Project Impacts

| IMPACT: describe (+ or -) | Permanence/Reversibility | Significance (Low, Medium, High) |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|
| Direct Impacts Road fill and construction of buildings, parking lots and infrastructure is expected to directly impact wetlands, resulting in a permanent wetland loss. | Loss of wetland is expected to be permanent. | High |
| Secondary Impacts (including impacts which are indirectly attributable to the project) Road construction is expected to alter wetland hydrology; increased runoff/nutrient loading are expected to result in degradation of wetland habitats and water quality; wells may result in drawdown of water table. | Alterations to wetland hydrology, habitat, water quality, and water table are likely to be permanent, however, these areas are already in a degraded state and changes may not be severe. | Medium |
| Cumulative Impacts Additional development beyond the current proposed plan has the potential to impact additional wetlands. | Additional wetland loss would be permanent. | |
| Spatial/Habitat Integrity Construction of access roads is expected to result in fragmentation of habitat blocks. | Habitat fragmentation is expected to be permanent. | High |
| Rare Plant/Animal Communities/ Natural Areas Construction of golf course infrastructure is expected to result in loss or degradation of plant communities and rare species habitats. | Loss of rare plants/animals and communities is expected to be permanent and irreversible. Impacted species within the degraded wet meadow include blue-winged teal. | Medium |

Sheboygan County, Wisconsin**

2014 Species List - Wet Meadow (degraded)

| Scientific Name | Common Name | Native | Physiognomy | Coefficient of Conservatism | Region 3 Wetland Coefficient |
|---------------------------------------|-----------------------------|------------|-------------|-----------------------------|------------------------------|
| <i>Alisma triviale</i> | northern water-plantain | native | forb | 4 | -5 |
| <i>Alnus incana</i> | speckled alder | native | tree | 4 | -3 |
| <i>Asclepias incarnata</i> | marsh milkweed | native | forb | 5 | -5 |
| <i>Asclepias syriaca</i> | common milkweed | native | forb | 1 | 5 |
| <i>Athyrium angustum</i> | common lady fern | native | fern | 5 | 0 |
| <i>Bidens cernua</i> | nodding beggar-ticks | native | forb | 4 | -5 |
| <i>Boehmeria cylindrica</i> | small-spike false nettle | native | forb | 6 | -5 |
| <i>Calamagrostis canadensis</i> | blue-joint grass | native | grass | 5 | -5 |
| <i>Callitriche palustris</i> | common water-starwort | native | forb | 8 | -5 |
| <i>Cardamine pensylvanica</i> | pennsylvania bitter-cress | native | forb | 3 | -3 |
| <i>Carex lacustris</i> | common lake sedge | native | sedge | 6 | -5 |
| <i>Cinna arundinacea</i> | common wood-reed | native | grass | 5 | -3 |
| <i>Cirsium arvense</i> | canada thistle | non-native | forb | 0 | 3 |
| <i>Eleocharis obtusa</i> | blunt spike-rush | native | sedge | 3 | -5 |
| <i>Elymus virginicus</i> | virginia wild-rye | native | grass | 6 | -3 |
| <i>Eutrochium maculatum</i> | spotted joe-pye-weed | native | forb | 4 | -5 |
| <i>Fraxinus pennsylvanica</i> | green ash | native | tree | 2 | -3 |
| <i>Helenium autumnale</i> | common sneezeweed | native | forb | 4 | -3 |
| <i>Iris virginica</i> | southern blue flag | native | forb | 5 | -5 |
| <i>Laportea canadensis</i> | canadian wood-nettle | native | forb | 4 | -3 |
| <i>Lemna minor</i> | common duckweed | native | forb | 4 | -5 |
| <i>Ludwigia palustris</i> | marsh seed-box | native | forb | 4 | -5 |
| <i>Lycopus uniflorus</i> | northern bugleweed | native | forb | 4 | -5 |
| <i>Lythrum salicaria</i> | invasive purple loosestrife | non-native | forb | 0 | -5 |
| <i>Matteuccia struthiopteris</i> | ostrich fern | native | fern | 5 | 0 |
| <i>Mentha arvensis</i> | wild mint | native | forb | 3 | -3 |
| <i>Mimulus ringens</i> | allegheny monkey-flower | native | forb | 6 | -5 |
| <i>Onoclea sensibilis</i> | sensitive fern | native | fern | 5 | -3 |
| <i>Osmunda claytoniana</i> | interrupted fern | native | fern | 6 | 0 |
| <i>Persicaria amphibia</i> | water smartweed | native | forb | 5 | -5 |
| <i>Persicaria hydropiperoides</i> | false water-pepper | native | forb | 6 | -5 |
| <i>Persicaria punctata</i> | dotted smartweed | native | forb | 5 | -5 |
| <i>Phalaris arundinacea</i> | reed canary grass | non-native | grass | 0 | -3 |
| <i>Pilea fontana</i> | bog clearweed | native | forb | 7 | -3 |
| <i>Pilea pumila</i> | canadian clearweed | native | forb | 3 | -3 |
| <i>Ranunculus hispidus</i> | hispid buttercup | native | forb | 6 | 0 |
| <i>Rorippa palustris</i> | common yellow-cress | native | forb | 3 | -5 |
| <i>Rosa palustris</i> | swamp rose | native | shrub | 7 | -5 |
| <i>Rumex britannica</i> | great water dock | native | forb | 8 | -5 |
| <i>Sagittaria latifolia</i> | broad-leaved arrowhead | native | forb | 3 | -5 |
| <i>Salix discolor</i> | pussy willow | native | tree | 2 | -3 |
| <i>Salix petiolaris</i> | meadow willow | native | shrub | 6 | -3 |
| <i>Schoenoplectus tabernaemontani</i> | soft-stem bulrush | native | sedge | 4 | -5 |
| <i>Scirpus cyperinus</i> | wool-grass | native | sedge | 4 | -5 |
| <i>Scutellaria lateriflora</i> | mad-dog skullcap | native | forb | 5 | -5 |
| <i>Sium suave</i> | hemlock water-parsnip | native | forb | 5 | -5 |
| <i>Sparganium americanum</i> | american bur-reed | native | forb | 8 | -5 |
| <i>Sparganium eurycarpum</i> | common bur-reed | native | forb | 5 | -5 |
| <i>Symphotrichum oolentangiense</i> | azure aster | native | forb | 5 | 5 |
| <i>Symplocarpus foetidus</i> | skunk-cabbage | native | forb | 8 | -5 |
| <i>Thalictrum dasycarpum</i> | tall meadow-rue | native | forb | 4 | -3 |
