EXECUTIVE SUMMARY

Kohler Company ("Kohler") seeks to develop an 18-hole public golf course, a clubhouse and support amenities on 247 acres of undeveloped private land owned by Kohler. The project creates a unique opportunity to open 247 acres of private property for public enjoyment and recreational use, enhance Sheboygan County's reputation as one of the world's premier golf destinations, and at the same time, preserve and enhance many of the Property's environmental features and attributes for the long term.

The Property is located between the Black River and Lake Michigan, north and east of the Kohler-Andrae State Park (State Park) in the Town of Wilson, Sheboygan County, Wisconsin. Kohler acquired a total of approximately 468 acres in the vicinity during the 1930's. In 1965, Kohler donated 221 acres to the State of Wisconsin for the creation of the John Michael Kohler State Park. The remaining 247 acre parcel retained by Kohler in private ownership is uniquely suited for a premier 18-hole golf course.

With its Lake Michigan vistas, rolling topography and unique natural features, the property offers an unparalleled setting for a spectacular golf in forest and dunes experience. Kohler again intends to tap world-renowned designer Pete Dye to design a course that will rival the top 50 courses in the world. Page vi of the Executive Summary contains the proposed golf course plan (Figure ES-1). The proposed course, together with Kohler's other championship golf courses in the area, will maintain the reputation of Sheboygan County as one of the premier golf destinations in the world.

An economic impact study by S. B. Friedman Development Advisors estimates the proposed golf course will generate over \$20 Million in annual economic output for Sheboygan County, 227 full time equivalent jobs, and over \$1.1 Million in new tax revenue per year. In developing this project, Kohler is not requesting any public financing, tax incremental financing or public-funded infrastructure.

Golf course land use is appropriate at the Kohler Property. "Golf courses with country club/restaurant facilities/driving ranges" are allowable as conditional uses in the P-1 Park and Recreation District that applies to the property under the Town of Wilson zoning code. Kohler is not proposing any changes to Town zoning.

The project will not compromise the property's natural features. To the contrary, Kohler and Dye will design the course and all amenities as respectful environmental stewards, with a minimalist approach striving to maintain the character of natural features. The proposed golf course will integrate many existing trees, dunes and natural contours, and minimize environmental impacts. During project planning, several conceptual course layouts and entrance alternatives were identified, characterized and evaluated. The proposed alternative minimizes impact on neighbors, regulated natural features, and the State Park.

Less than 5 acres of wetland will be affected, a reduction of over 80 percent from initial course layouts. Wetland mitigation would be provided through approved programs, resulting in a net increase in wetland habitat.

While construction activities within the floodplain are unavoidable and may involve minor filling, the project will result in minimal increase to floodplain elevations.

Habitat for regulated endangered plant species will generally be preserved. To the extent possible, any impacted plants will be transplanted to nearby areas with similar characteristics. Invasive species such as thorny Japanese barberry will be removed, and Kohler will monitor invasive species on an on-going basis to improve overall habitat. The management of invasive species will have a significant, long term positive benefit to the property and biological community. Invasive species removal allows native plant communities to repopulate, significantly enhancing the habitat, and promotes increases in biological and wildlife diversity.

The use of pesticides and fertilizers is highly regulated at both the State and Federal levels to protect surface and groundwater. Kohler has a proven record of employing the best management practices regarding use of approved pesticides and fertilizers on its golf courses and its courses have never been cited for an environmental violation. Kohler will implement an integrated pest management plan to minimize pesticide and fertilizer usage at the new course—just as it does at its other golf courses. With these methods, in 2014, Kohler applied fertilizer at rates on its other golf courses that were significantly less than Wisconsin Administrative Code maximums: 32 percent of maximum on tees, 40 percent of maximum on greens and only 20 percent of authorized state and federal maximum levels on fairways.

A ground water study was completed to determine the potential impacts on neighboring residential wells from irrigating the proposed golf course. Based upon the field investigation, pumping tests, and a review of well logs from the area, golf course irrigation is not anticipated to adversely impact the surrounding neighborhood. Kohler will proactively manage its water usage to minimize irrigation, employing computerized irrigation systems, soil moisture sensors and daily inspections.

Kohler will manage storm water consistent with Town of Wilson and WDNR best management practices, reducing post-development peak flow rates to pre-development rates, removing 80 percent of total suspended solids and infiltrating at least 90 percent of storm water infiltrated prior to development.

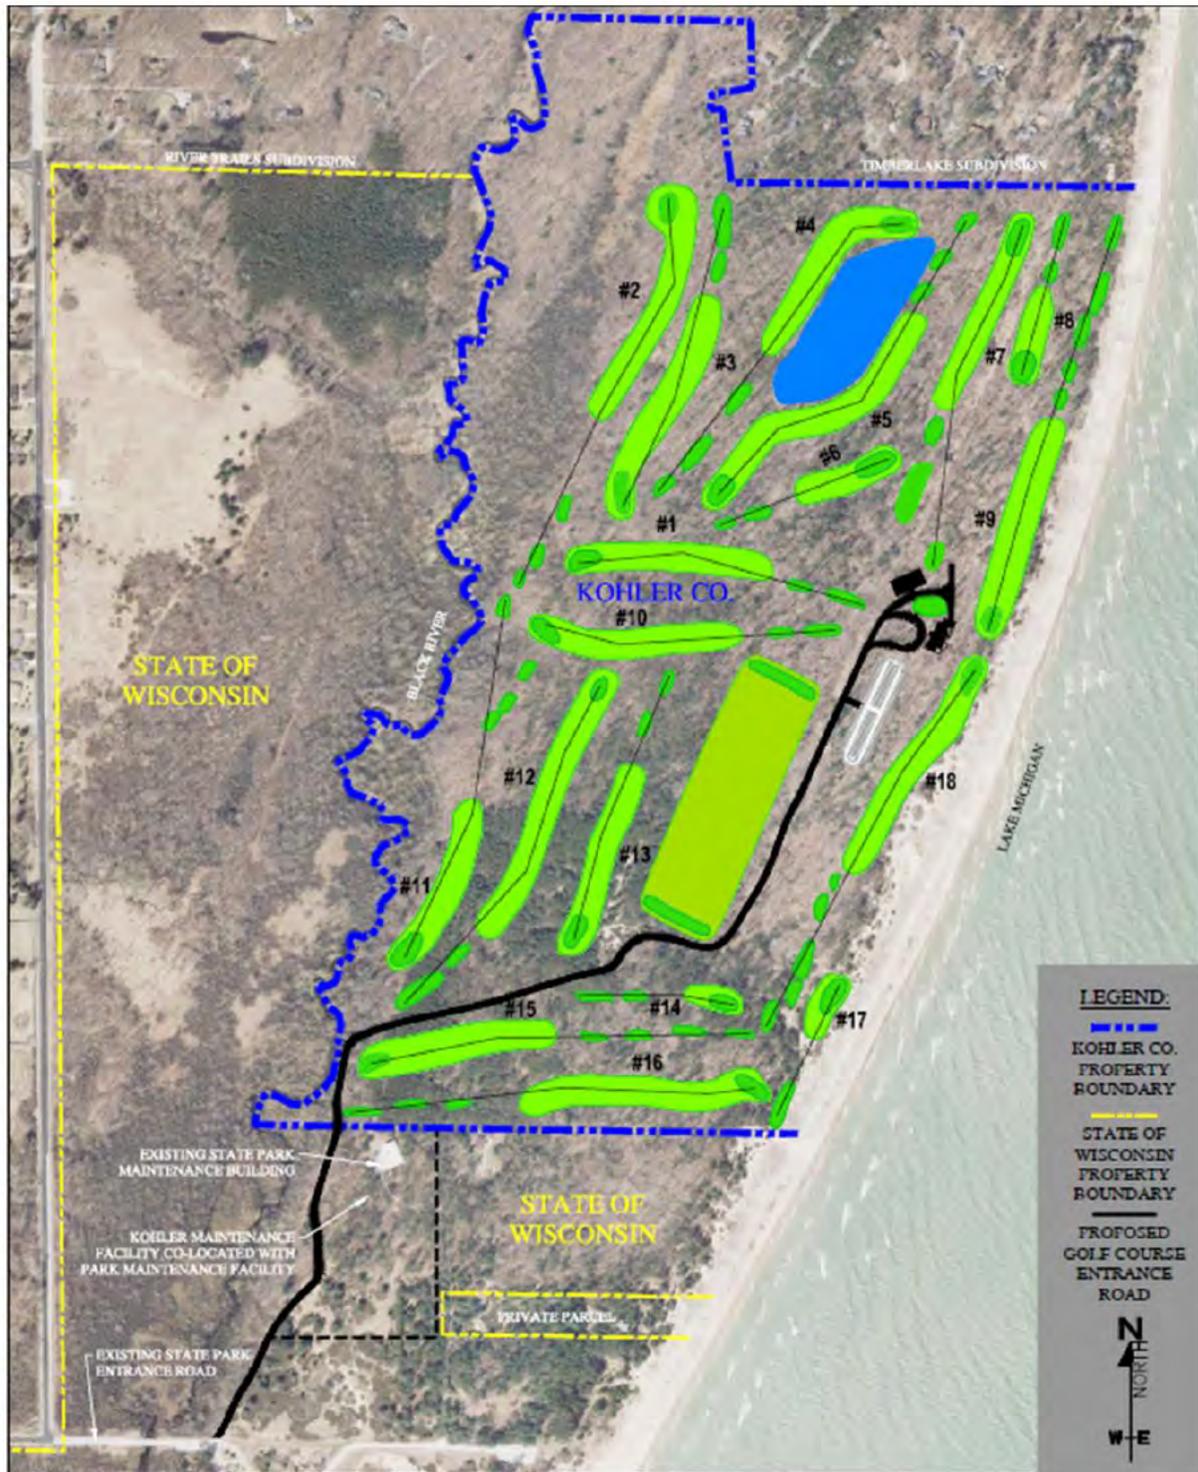

Kohler investigated numerous alternative entrance routes to the Property resulting in a proposed route that has the least impact on both the neighbors and environment. Access through residential neighborhoods to the north was investigated but not recommended due to traffic impacts to area residents. Multiple routes originating off 12th Street through the State Park were also investigated, but determined more impactful than the route being proposed. A traffic study was completed and concludes that the studied intersections significantly exceed widely-accepted Level of Service (LOS) standards. While no traffic improvements are required, Kohler is proposing to modify the State Park entrance area by adding a roundabout, east of the existing bridge spanning the Black River to further improve circulation. Two lanes would be dedicated for entering State Park visitors while golf course traffic and exiting State Park visitors would utilize the roundabout. Kohler would fund the entire cost of the improvements.

The proposed golf course entrance road location is similar to that recommended by both WDNR and the Town of Wilson for a previous development project. The route and maintenance facility placement will require an easement from the WDNR on approximately 4 acres of land already dedicated to park maintenance. Specifically, Kohler proposes to: i) enhance the current entrance to the State Park off Beach Park Road and utilize an existing bridge over the Black River, thus avoiding the need for another crossing over the Black River; and, ii) build a maintenance facility close to the State Park maintenance building providing the State an opportunity to upgrade the utilities at its building.

The proposed golf course avoids, minimizes, and mitigates environmental impact of both its construction and long term operations. On balance, Kohler believes that the benefits of its proposed golf course project far outweigh any adverse impact.

ENVIRONMENTAL IMPACT REPORT
PROPOSED GOLF COURSE – TOWN OF WILSON – KOHLER COMPANY

Figure ES-1 Proposed Golf Course Plan

1.0 PROJECT SUMMARY

Kohler Company ("Kohler") seeks to develop an 18-hole public golf course (the "Project") on 247 acres of private land owned by Kohler between the Black River and Lake Michigan, north and east of Kohler-Andrae State Park (the "State Park"). The Project will be limited to Kohler Company owned property and an approximate 4 acre State Park easement north of Beach Park Road on State land that is not typically utilized by the public. For the Project to move forward, various Federal, State, and local permits and approvals will be required, including approvals from the Wisconsin Department of Natural Resources (WDNR).

In preparation for submitting this environmental impact report (EIR) to the WDNR, numerous biological, cultural, and socio-economic studies were completed to evaluate existing and proposed conditions.

This EIR supports the various permit applications for the Project, provides a description of existing environmental conditions, assesses human and environmental impacts that may result from the Project, and summarizes the mitigation measures to be implemented to avoid and/or minimize environmental impacts.

Throughout the Project planning process, a final layout has been developed that reduces impacts, including: reducing wetland impacts from greater than 25 acres to less than 5 acres; reducing the area of tree clearing to approximately 50 percent; utilizing an existing bridge to avoid impacts to the Black River and associated floodplain; reducing the need for an easement on State Park property by 85 percent (from 33 acres to approximately 4 acres), while avoiding existing trails west of the Black River.

1.1 PROPOSED ACTION

Kohler proposes to create a public 18-hole golf course on Kohler-owned property (the "Kohler Property"). The Project is located north of the State Park in the Town of Wilson (Figures 1-3). The course will be designed by Pete Dye, a world-renowned golf course designer who successfully designed Kohler's Blackwolf Run and Whistling Straits golf courses in Sheboygan County.

Access to the Kohler Property is proposed through a 4 acre easement on the adjacent State Park property to the south. This portion of the State Park is not typically utilized by the public and contains an existing park maintenance building and residence for the Park Ranger. Similar to a proposed development previously recommended by the WDNR and the Town of Wilson, access to the Kohler Property will require the construction of a two lane asphalt entrance road. This route will allow for the utilization of an existing Black River bridge crossing thereby minimizing impacts to the river and adjacent floodplain.

A maintenance facility will also be constructed relatively close to the existing park maintenance building on that portion of State Park property not typically utilized by the public. The Kohler maintenance facility will be used for golf course grounds maintenance support and storage. As a direct benefit to the State Park, enhanced public utilities will be available to upgrade the park's maintenance building, along with the occasional use of the entrance road for park maintenance operations.

A multi-level clubhouse will be erected on the Property that encompasses minimalist design elements and concepts. The 13,000 to 16,000 square foot clubhouse will include a Lake Michigan observation tower, restaurant, locker room, lobby, bar area, retail, and outdoor wedding and special event space. A guest and associate parking lot will be located near the clubhouse and include a bag drop area. The clubhouse will be designed to be eligible for

Leadership in Energy and Environmental Design (LEED) certification, and include the use of timber and canvas materials as architectural features.

A caddie/cart barn and two on-course rest stations will be constructed on the Kohler Property.

1.2 PROJECT LOCATION

The Kohler Property is located in part of Section 14 of Township 14 North, Range 23 East, in the Town of Wilson, Sheboygan County, Wisconsin (Figures 1 and 2). Lake Michigan borders the Kohler Property to the east, and the State Park borders the Kohler Property to the west and south. Residential neighborhoods are adjacent to the north boundary. South 12th Street is located west of the State Park property (Figure 3 and 4).

Kohler originally acquired approximately 468 acres of property in the area during the 1930s. In 1965, Kohler donated 221 acres to the State of Wisconsin for the creation of the John Michael Kohler State Park, while retaining the remaining 247 acre parcel which is the subject of this report.

1.3 PURPOSE AND NEED

The purpose of the Project is to open the Kohler Property to public use as a high quality 18-hole golf course and associated facilities to benefit the local economy and to provide community-friendly and environmentally sensitive access to the golf course. An entrance road from Beach Park Lane through the State Park provides public access to the Kohler Property in a manner that reduces traffic issues for the surrounding residential neighborhoods.

The Project presents an extraordinary opportunity to open 247 acres of private lands to the public. In the past, authorized access to this private property was limited to a relatively small number of individuals. This project creates access for the general public to enjoy the property, whether that be by playing a round of golf or taking in the beauty of Lake Michigan from the clubhouse.

Golf is more than an enjoyable pastime; it is a key industry contributing to the vitality of the nation's economy. Golf attracts businesses and visitors, drives residential and recreational development and creates demand for a variety of goods and services. In 2008, Wisconsin's golf industry generated approximately \$2.4 billion of direct and indirect economic output, \$771.5 million of wage income and 38,431 jobs. (SRI International, 2008).

The economic benefits of a new golf course are measured in more than just recreation and business travel dollars. Benefits begin with millions of dollars of planning, design and construction work. Once constructed, a course creates jobs along with state and local income including sales and property taxes. In addition, a new golf course, and a championship-caliber course in particular, has a "multiplier effect," infusing wages and benefits to circulate through the local economy, increasing property values and ancillary public and private benefits.

Wisconsin is recognized as a golf mecca. *Golf Digest* ranked Sheboygan County as the number seven golf destination in the world in its 50th anniversary issue. (See Table 1.1 below of the top ten golf destinations in the world.) In its 2015/2016 America's 100 Greatest Public Courses, *Golf Digest* ranked all four Kohler courses in the top 100: #4 – Straits course, #16 – Rivers course, # 47 – Irish course, and #72 – Meadow Valleys course. All four courses at Blackwolf Run and Whistling Straits were among the top 10 in the State of Wisconsin led by the Straits course being ranked #1. Also, in its World's Best Golf Destinations 2014/2015 rankings, *Golf Odyssey* ranked The American

Club as the Best Overall U.S. Resort. In determining this ranking, the publication evaluated golf, lodging, dining and activities.

1.4 DEVELOPER OF PROJECT

Kohler was founded in 1873 and is headquartered in Kohler, Wisconsin. It is Sheboygan County's top employer and one of America's oldest and largest privately held companies. Kohler has presence on six continents and is a global leader in the design and manufacture of kitchen and bath products; engines and power systems; premier furniture, cabinetry and tile; and is the owner/operator of two of the world's finest five-star hospitality and golf resort destinations in Kohler, Wisconsin and St Andrews, Scotland.

The Kohler golf tradition in Sheboygan County began in 1985 when Herb Kohler hired world-renowned architect Pete Dye to design Blackwolf Run. Pete Dye is one of only five golf course designers inducted into the World Golf Hall of Fame. His design philosophy is environmentally sensitive, utilizing the natural terrain and preserving natural site features. Building on Blackwolf Run's reputation, Kohler added Whistling Straits, another Pete Dye design, in 1995. What immediately becomes apparent with all of Kohler's golf courses is the unique sensitivity and respect to the surroundings of the immediate area. Nowhere to be found are ancillary or contiguous housing or commercial developments that are almost always present near golf courses throughout the United States.

Kohler's success in the golf world leverages Kohler's success in its hospitality venues. Kohler became a hospitality destination in 1981, when it converted a worker boarding house into an elegant, luxury hotel with upscale restaurants and amenities. Today, The American Club is Wisconsin's only Forbes Five-Star hotel with an AAA five diamond resort designation. In addition to The American Club, Destination Kohler offers not only outstanding accommodations and dining options, but also Kohler Waters Spa, Sports Core Health and Racquet Club, The Shops at Woodlake, Kohler Design Center and countless other high quality amenities and events within Sheboygan County, including River Bend, a meticulously restored residence of former Governor Walter J. Kohler and River Wildlife a 500 acre environmentally sensitive wildlife preserve.

Kohler, along with the Kohler Trust for Preservation, also jointly owns and manages Eagle Valley, a 1500 acre nature preserve nestled on top of the cliffs of the Mississippi River in southwestern Wisconsin. In 2012, Kohler and Herb Kohler created the Kohler Environmental Center on 260 acres of land in Wallingford, Connecticut placing Choate Rosemary Hall on the leading edge of secondary education in the United States.

Kohler's experience and expertise in developing, managing and operating all of these properties over the years shows a proven track record and is evidence of Kohler's commitment to environmental responsibility, sustainability, innovation and high standards of execution.

The proposed Project will be the latest world-class Kohler golf course designed by Pete Dye. The uniqueness of the location, the setting and the terrain provide a one-of-a-kind opportunity to create a world class, golf in forest and dunes destination. The Kohler commitment to excellence, as evidenced by the success of its other hospitality venues in the area, including the American Club, Blackwolf Run and Whistling Straits, will create a critical mass unrivaled in the United States.

1.5 AUTHORITIES AND APPROVALS

The uniqueness and location of the Project requires permits and approvals from Federal, State, and local authorities as summarized in Table 1-2. Kohler is committed to collaborating and systematically investigating development options that protect the environment, and increase public access to the Kohler Property.

The various permitting processes create an opportunity for regulatory agencies and Kohler to work together to create a one-of-a-kind golf destination in an environmentally sensitive way. Table 1-2 summarizes the permits and associated regulatory agency collaboration anticipated for this Project.

Table 1-2. Anticipated Permitting Requirements for the Project

| AGENCY | INTEREST OR PERMIT |
|-------------------------------------------|-------------------------------------------------------------------------------------|
| U.S. Army Corps of Engineers | Section 404 Clean Water Act Permit for Wetland Discharge |
| National Park Service | Conversion of Land and Water Conservation Fund Act Lands |
| U.S. Fish and Wildlife Service | Threatened and Endangered Species Protection |
| Wisconsin Department of Natural Resources | Section 401/NR 103 Wetland Discharge |
| Wisconsin Department of Natural Resources | Chapter 30 Grading Permit |
| Wisconsin Department of Natural Resources | NR 150 Environmental Impact Statement |
| Wisconsin Department of Natural Resources | Threatened and Endangered Species Protection |
| Wisconsin Department of Natural Resources | NR 151/NR216 Construction Time Storm Water Discharge Permit |
| Wisconsin Department of Natural Resources | Sanitary Permit |
| Wisconsin Department of Natural Resources | High Capacity Well Permit |
| State Historic Preservation Office | Archaeologic Consultation |
| Sheboygan County | Shoreland-Floodplain Conditional Use Permit; Zoning Permit; Sanitary Permit |
| Town of Wilson | Conditional Use Permit; Storm Water Permit; Erosion Control Permit, Building Permit |

1.5.1 Federal

1.5.1.1 U.S. Army Corps of Engineers (USACE)

The Project will require compliance with Section 404 Clean Water Act (CWA) administered by the USACE for wetland impacts.

1.5.1.2 National Park Service (NPS)

The State Park property is funded by the NPS Land and Water Conservation Fund Act (LAWCON). Use of State Park property will require approval from the NPS. The proposed easement area of use is approximately 4 acres of State Park property.

1.5.1.3 U.S. Fish & Wildlife Service (USFWS)

The Project will require USFWS review and compliance with the Endangered Species Act and Migratory Bird Treaty Act (MBTA).

1.5.1.4 Federal Emergency Management Agency (FEMA)

No significant increases are expected to floodplain elevations.

1.5.2 State of Wisconsin

1.5.2.1 Wisconsin Department of Natural Resources (WDNR)

The Project will require permits and approvals from the WDNR, including:

- Wetland Water Quality Certifications, Wetland Fill and Wetland Compensatory Mitigation (Wis. Adm. Code Chapter NR 103, Section 401 Clean Water Act)
- Grading (Wis. Stat. §30.19, Section 404 Clean Water Act)
- Individual Permit, Irrigation Pond with wetland impacts (Section NR 103, Wis. Adm. Code)
- Storm water (WPDES Sections NR 216 and NR 151, Wisc. Adm. Code)
- High Capacity Well Permit (Section NR 812, Wisc. Adm. Code)
- Sanitary Permit (WPDES Section 283, Wisc. Adm. Code)

Kohler requested an Endangered Resource Review from the WDNR for this Project. Coordination with the WDNR regarding endangered resources is ongoing.

Kohler understands that the WDNR will require an Environmental Impact Statement under Section NR 150 (Wis. Adm. Code) to ensure that the WDNR and the public have comprehensive information to fully consider the short and long term effects of the Project.

1.5.2.2 Wisconsin State Historic Preservation Office (SHPO)

Kohler has undertaken extensive historical and archaeological surveys of the property. Consultation with the SHPO will occur upon completion of the surveys.

1.5.3 Local

1.5.3.1 Sheboygan County

Kohler will seek a shoreland/floodplain conditional use and zoning permit from Sheboygan County, along with a request for wetland rezoning per Chapter 72, Shoreland Ordinance. A zoning permit and sanitary permit will also be required from the County Planning Department for this Project.

1.5.3.2 Town of Wilson

The Project will require a conditional use permit from the Town of Wilson. The golf course is allowable as a conditional use in the current P-1 Parks and Recreation District.

2.0 PROPOSED PHYSICAL CHANGES

2.1 MANIPULATION OF TERRESTRIAL RESOURCES

Construction of the Project will include the following activities: selective tree removal, grading, installation of utilities, including septic and irrigation systems, excavation of an irrigation pond, construction of an access road and cart paths, construction of new buildings, and construction of the golf course.

Vegetation will be removed from the footprint of the golf course fairways, greens and tees. Mature trees and other native vegetation will be retained between the golf holes where possible. Vegetation will also be removed from the access road and utility right-of-way, building footprints, septic fields, irrigation system, and driving range. It is anticipated that approximately 50 percent of the existing trees will remain following construction. As part of this development, invasive plant species will be managed on the Kohler Property.

Site grading is anticipated to be minimal across the site. The site designer intends to respect major dune structures and natural contours of the Property. The largest topographic change will be the excavation of an approximate five-acre irrigation pond. The spoils from the irrigation pond may be used on-site.

The vegetation within the footprint of golf holes (tees, greens, fairways) and driving range will be replaced with turfgrass. Native vegetation and trees will be planted during the final landscape phase to enhance the aesthetics and habitat value on the site, replacing some of the specimens and invasive species removed. The majority of the club house landscaping and the non-turfgrass areas on the course will be composed of native vegetation.

Infrastructure to be constructed on the site includes the access road, the cart paths, the parking lots, the rest stations (2), the maintenance buildings, the club house, and the caddie/cart barn.

2.2 MANIPULATION OF WATER RESOURCES

2.2.1 Waterways

No disturbance of public waterways is proposed.

The Project will not withdraw surface water from the Black River or Lake Michigan. The Property does not have access to a public water supply, so feasibility studies were conducted to determine a source for irrigation and potable water supply for the Project. Surface water sources were found to be infeasible.

Access to the Property is planned to utilize the existing Beach Park Lane crossing of the Black River. This route avoids creating an additional river crossing and avoids direct impacts to the Black River and associated floodplain.

2.2.2 Ground Water

Based on the feasibility studies, groundwater pumped from the bedrock aquifer is the best option for the irrigation supply (Layne 2014, Excel 2014a, Stantec 2014a). An on-site well will pump water from the bedrock aquifer to an irrigation pond for storage and use. Refer to Section 2.3.7 for groundwater pumping information.

The shallow groundwater aquifer is located within the overlying sand layer, at places within three feet of the ground surface. Domestic wastewater septic systems will be constructed to provide adequate separation from the shallow groundwater.

Groundwater modeling data indicates operation of the irrigation system is not anticipated to impact adjacent private water supply wells. As a special insurance, Kohler will fund and develop a program with the Town of Wilson to mitigate potential impacts to adjacent private water supply wells, similar to the program that was successfully implemented at Whistling Straits.

2.2.3 Floodplain

A portion of the proposed golf course will be constructed along the east perimeter of the Black River floodplain. Construction within the floodplain may include minor filling for a small portion of the golf course and the entrance road. Increases to the floodplain elevation are anticipated to be minimal.

2.2.4 Wetland Impacts

The Project will result in less than 5 acres of wetland impacts scattered in various areas across the entire 247 acre property. Construction within wetlands is expected to include fill placement. The volume of fill has not yet been calculated, as the process of avoiding and minimizing wetland impacts is ongoing. Wetland mitigation is planned to offset all wetland impacts, resulting in a net increase of wetlands.

2.3 BUILDINGS, TREATMENT UNITS, ROADS AND OTHER STRUCTURES

2.3.1 Course Layout

This Project is the latest world-class Kohler golf course designed by Hall of Fame golf course architect Pete Dye. The course will be developed with a goal of ranking in the top 50 courses in the world upon maturity. Corridors will be opened to sunlight, and views of Lake Michigan while removing invasive species and maintaining approximately half of the trees on the Property. The dunes and their natural contours would be respected and are essential to the design.

The 18-hole golf course will be located entirely on the Kohler Property (Figure ES-1). An approximate 5 acre irrigation pond is planned in the northern portion of the Kohler Property, while the practice range is planned to be in the south portion. The clubhouse and other amenities are centrally located.

2.3.2 Clubhouse

A multi-level clubhouse is planned to be between 13,000 and 16,000 square feet in size and consist of areas designated for indoor/outdoor dining, bar area, locker rooms, retail, and banquet room. The clubhouse building would be designed to be eligible for LEED certification, and include the use of timber and canvas materials as architectural features.

The restaurant in the clubhouse will be available to the public and would open in spring and remain open through the New Year's holiday season. The dining area could accommodate approximately 60 interior dining seats and 50 exterior dining seats. The banquet room would have a capacity for up to approximately 70 people for special event functions. A Lake Michigan observation tower will also be accessible to guests.

A parking lot located near the clubhouse will accommodate approximately 150 guest vehicles.

2.3.3 Maintenance Building

The maintenance facility is planned to include approximately 22,000 square feet of building space. Functions within the maintenance building include administrative offices, locker rooms, equipment storage, equipment wash and repair, and a dedicated self-contained area for

storage, mixing, and loading of plant protectants. A closed loop system for the equipment wash is planned that would capture, filter, and re-use water from the wash area.

2.3.4 Entrance Road

Eight entrance routes were investigated to identify a preferred route for guest and operational traffic. All entrance route options are constructible and viable; however the presence of environmental encumbrances and current use results in certain routes being more desirable than others. Eight maintenance building locations were considered in co-locations with the entrance routes. Section 4.2.3 presents the entrance route locations.

The benefits of Alternative E include:

- Minimizes impacts to the floodplain by avoiding the creation of a new bridge crossing the Black river
- Minimizes wetland impacts to the least amount of all alternatives
- Avoids State Park recreational areas and trails
- Avoids impacts to cultural resources
- Avoids traffic through residential areas to the west and north of the property

The two-lane entrance road and maintenance facility requires an approximately 4 acre easement through State Park property, north of Beach Park Lane, in an area not typically utilized by the public.

A traffic study was completed and concludes that the studied intersections significantly exceed widely-accepted Level of Service (LOS) standards. While no traffic improvements are required, Kohler is proposing to modify the State Park entrance area by adding a roundabout, east of the existing bridge spanning the Black River to further improve circulation. Two lanes would be dedicated for entering State Park visitors while golf course traffic and exiting State Park visitors would utilize the roundabout. Kohler would fund the entire cost of the improvements. Additional details on the Traffic study are provided in Section 3.3.2.

2.3.5 Utilities

Based upon preliminary discussions with utility providers (gas, electric, communications), it is anticipated that service connections will be extended from existing facilities located in County Trunk Highway V (CTH V) approximately one-half mile west of the Kohler Property. The new services will be bored beneath State Park property wetlands and the Black River within an agreed-upon easement less than one acre in size. Potable water and irrigation water will be provided by on-site wells and testing has been completed that confirms conventional septic field systems can be used to treat domestic wastewater.

2.3.6 Integrated Pest and Nutrient Management

The use of pesticides and fertilizers is highly regulated at both the State and Federal levels to protect surface and groundwater. Kohler has a proven record of employing the best management practices regarding use of approved pesticides and fertilizers on its golf courses and its courses have never been cited for an environmental violation.

Kohler uses an integrated pest management (IPM) approach at all of its golf properties as a sustainable method for managing pests and intends to adopt the same plan for this Project. The plan consists of six steps:

1. Identify the pest (Kohler subscribes to the Wisconsin Turfgrass Disease Diagnostic lab at UW-Madison for next-day microscopic pest identification and control recommendations)
2. Develop a control plan/strategy
3. Establish threshold limits for the pest
4. Monitor the pest populations
5. Control the pest
6. Evaluate and/or redesign the plan

The foundations of the IPM plan include the latest horticulture practices (fertilization, soil tests, irrigation, drainage and minimizing turf stress) to promote healthy, vigorous plants that withstand pest outbreaks without pest controls. Managers are educated in the biological lifecycle of pests so when pest populations approach a control threshold they can predict outbreaks, assess damage potential and time control at the most effective lifecycle stage. Pest control measures are first attempted by physical, mechanical and cultural controls. The use of a pesticide is a last consideration after other measures are unsuccessful. Pesticide applications are made to specific target areas to reduce the overall size of the treatment area. All golf course management staff are pesticide applicator certified by the Wisconsin Department of Agriculture, Trade, and Consumer Protection (DATCP).

Nutrient management is a key part of the project specific IPM plan and the ability to support healthy growth of the turfgrass. Kohler will develop a nutrient management plan for the project similar to the plans used at the other Kohler courses in the region. Fertilizers will be applied based on current soil tests, and the fertilization component of the IPM plan will be evaluated and modified as necessary each year. The Kohler golf course fertilization program is constantly being modified to incorporate the latest technologies including slow release and organic products.

Section NR151 of the Wisc. Admin. Code mandates an annual maximum amount of nutrients that can be applied to golf course turfgrass areas to protect surface and groundwater. In 2014, all Kohler golf courses in Sheboygan County, on average and in total, applied fertilizer at only 32 percent of the maximum amount on tees, 40 percent of the maximum amount on greens and only 20 percent of authorized state and federal levels on fairways.

2.3.7 Irrigation and Water Best Management Practices

Based on the 18-hole historical irrigation records at the Blackwolf Run and Whistling Straits Golf Courses, irrigation system flow rates of up to 1,500 gallons per minute (gpm) and average long term volumes of 15,000,000 to 25,000,000 gallons per year can be anticipated. The average pumping volume during the peak months of the last seven years at the Kohler golf courses was 190,000 gallons per day (gpd) per 18-holes, with a peak of 334,000 gpd during the driest months of the 2012 drought. Kohler anticipates that similar rates and volumes will be needed for this Project.

Kohler investigated several alternatives for sourcing irrigation water from surface waters, including a Lake Michigan submerged intake, a Ranney collector well system, a Black River intake, and using wastewater from the City of Sheboygan wastewater treatment plant (WWTP).

The Lake Michigan submerged intake was found to be unfeasible due to significant potential impacts to the lake bed during construction, concerns with zebra mussel interference at the intake, and damage from ice and wave action due to shallow lake water depths.

A Ranney collector well is a system which could extract Lake Michigan water from the adjacent saturated sandy beach areas. The advantages of this system include minimal impacts during construction and avoiding operational issues from zebra mussels. An on-site investigation and test borings completed in July of 2014 indicated extremely low hydraulic conductivity values making this alternative not technically feasible (Stantec, 2014a).

The Black River alternative was determined to be unfeasible after a 2014 investigation indicated the flow rates of the river would not meet the irrigation water demands without creating adverse impacts (Stantec, 2014a).

Reusing water from the WWTP is also not a feasible option due to potential environmental impacts, regulatory compliance constraints, and operational issues.

Similar to the existing Kohler golf courses, an irrigation well with a 450 gpm pump is planned to supply water to an irrigation pond. Water from the pond will be distributed via an underground irrigation system to the appropriate areas of the golf course.

Irrigation best management practices (BMPs) are employed at the existing Kohler golf courses and would be employed for the proposed Project as well. Kohler proactively manages irrigation water use in efforts to minimize volumes. Irrigation is carefully scheduled to match turf and soils conditions, to conserve water, reduce runoff, and prevent disease. Evapotranspiration rates and pending weather fronts are also factored into irrigation schedules. Other BMPs to regulate water use include:

- Computer controlled irrigation system for maximum efficiency
- Irrigation design is prescriptive; sprinklers are fully adjustable to water just the playing surfaces while avoiding native or out of play areas
- Use of soil moisture sensors to determine watering needs
- Use of quick couplers for hand water of isolated dry areas to prevent over watering of adjacent areas
- Cycle-soak feature automatically turns sprinklers off to prevent surface water run off until water has moved into soil to be used by plant roots
- Daily inspections of pressure readings and proper pump operation
- Low trajectory sprinkler nozzles apply water closer to the ground to minimize drift from wind
- Monthly irrigation system audits

2.3.8 Storm Water Management

The Town of Wilson and the WDNR require storm water management on this Project, as summarized below:

- Town of Wilson – The Town's storm water management code requires post-development storm water peak flow reduction and total suspended solids removal. It also mandates storm water infiltration facilities be provided. Specifically, the Town

requires post-development peak flow rates for the 2-year, 10-year, and 100-year storm events to not exceed their corresponding pre-development peak flow rates. The Town also requires 80 percent of the total suspended solids (TSS) be removed from post-development runoff and that the quantity of post-development storm water that is infiltrated exceed 60 percent of what infiltrated prior to development.

- WDNR – Similar to the Town, the WDNR has requirements for post-development storm water peak flow reduction, total suspended solids removal and infiltration. Specifically, the WDNR requires post-development peak flow rates for the 1-year and 2-year storms to not exceed their corresponding pre-development peak flow rates. They also require 80 percent of the TSS be removed from post-development runoff and that the quantity of post-development storm water that is infiltrated exceed 90 percent of what infiltrated prior to development.

Storm water management strategies have been developed to exceed the expected regulatory requirements for the Project. The strategies are based upon sandy soils and high infiltration rates associated with the Kohler Property. The bulk of the storm water management plan consists of filter strips which treat most impervious areas for quality and quantity prior to infiltrating and discharging to any nearby surface waters. For those areas that require more treatment (e.g., maintenance building), dry detention basins will be added to detain any additional runoff. Biofiltration areas may also be required to treat areas with concentrated flow that cannot drain to filter strips. These are depressed areas with three feet of engineered soil, mulch, and wetland type plantings. All treatment areas are planned to be constructed 5 feet above the anticipated high groundwater elevation or achieve 80 percent TSS removal prior to infiltrating.

2.4 ALTERNATIVES

2.4.1 ALTERNATIVE SITE LOCATION

The size and features of the Property are ideal for creating a world class golf course in Sheboygan County. The Lake Michigan shoreline, sand-based geology, natural contours, and sand dunes make this setting unique to Sheboygan County and the State of Wisconsin. Kohler has privately owned the property for over 75 years and currently operates four golf courses in Sheboygan County.

Kohler does not own and did not locate any comparable properties for sale along the Lake Michigan shoreline that had potential for a world-class golf course.

2.4.2 ALTERNATIVE DESIGNS

During project planning, four conceptual course layouts and eight entrance route alternatives were identified, characterized and evaluated. The course layout alternatives were considered in order to identify a preferred course design and minimize environmental impacts. The alternatives also include alternate maintenance building locations. The preferred alternative (Alternative E) has the least amount of wetland impacts of the twelve alternatives, minimizes impacts as much as practicable, and avoids impacts to recreational areas of the State Park and archaeologically significant human burial mounds.

Alternative drawings with course layout, entrance routes, and maintenance building locations are presented in Section 4.2.3. The following provides a summary of the alternative designs considered for this project:

No Build Alternative

The no-build alternative would mean the loss of the economic benefits created by the proposed project including 227 full-time equivalent permanent jobs and the generation of nearly \$21 million in annual economic activity for Sheboygan County households and businesses.

Additionally, the Property is currently closed to the public. The no-build alternative would negate the opportunity to open the Property for public enjoyment and deny creation of a recreational opportunity that complements the current land use of the Property and area. Currently the majority of property owners in Timberlake Subdivision do not have access to Lake Michigan. Contrary to the build alternatives, the no-build alternative does not allow for a lake access easement to be granted to the owners in Timberlake Subdivision.

Alternative A

The Alternative A course layout design is near maximum build-out which expands to the northwest within close proximity to the burial mounds, to the east on the beach adjacent to Lake Michigan, to the south on State Park property, and to the west within the Black River floodplain. The entrance route originates on South 12th Street, and traverses the southern part of the State Park property crossing wetlands and the Black River. The maintenance building is located in the west central portion of the Kohler Property, north of the entrance route within a [REDACTED]. This alternative would require an easement of more than 32 acres from the State of Wisconsin.

Alternative B-1

The Alternative B-1 course layout design is near maximum build-out within the existing Kohler Property, expanding to the northwest within close proximity to the burial mounds, to the east on the beach adjacent to Lake Michigan, to the south adjacent to the Kohler Property boundary, and to the west within the Black River floodplain. The entrance route originates on South 12th Street, further north than Alternative A, and traverses the State Park property crossing wetlands, recreational trails, and the Black River. The maintenance building is located in the central portion of the State Park property south of the entrance route within a degraded hardwood swamp and would be visually screened by a mound.

Alternative B-2

Alternative B-2 proposes the same course layout design and entrance route as Alternative B-1. The Alternative B-2 proposed maintenance building does not include the visual screening mound that is proposed in Alternative B-1. The entrance route originates on South 12th Street and traverses the State Park property crossing wetlands, recreational trails, and the Black River.

Alternative C

The Alternative C reduces the footprint of the course layout within the Kohler Property. Holes designed in the northwest location are moved further to the south away from the burial mounds. Holes within the Black River floodplain are moved further to the east. Holes adjacent to Lake Michigan are moved to the west.

The entrance route and maintenance building remain in the same location as Alternative B-2. The entrance route originates on South 12th Street and traverses the State Park property and crosses wetlands, recreational trails, and the Black River.

Alternative D-1

Alternatives D-1 through D-7 contain the same course layout design with alternate entrance routes and maintenance building locations to identify the location/route that minimize impacts.

The entrance route originates on South 12th Street, and traverses the southern part of the State Park property, crossing wetlands and the Black River. The maintenance building is located on the State Park property south of the entrance route within an [REDACTED] wet meadow, degraded wet meadow, hardwood swamp, and degraded hardwood swamp. This alternative would require an easement from the State of Wisconsin for the entrance road and maintenance facility located within the State Park property.

Alternative D-2

The entrance route begins on South 12th Street on the north end of the State Park property, crossing wetlands, recreational trails, and the Black River near the north-south midline of the Kohler Property. The maintenance facility is located in old field south of the entrance route. The entrance road to the maintenance facility crosses a degraded wet meadow. This alternative would require an easement from the State of Wisconsin for the entrance road and maintenance facility located within the State Park property.

Alternative D-3

The entrance route for Alternative D-3 begins at the intersection of Stahl Road and South 12th Street, in a Kohler-owned residential development immediately north of the Black River Trails State Park property; continues straight east crossing the Black River, and then south adjacent to the burial mounds to the approximate midline of the Kohler Property. The maintenance facility for Alternative D-3 is located on the upland area near the north edge of the State Park property south of the entrance route. This alternative would require an easement from the State of Wisconsin for the maintenance facility located within the State Park property.

Alternative D-4

The Alternative D-4 entrance route begins at the intersection of Stahl Road and South 12th Street, in a Kohler owned residential development immediately north of the State Park property. Alternative D-4 entrance route diverges from Alternative D-3, southeast across the State Park property, avoiding the burial mounds, and then east crossing the Black River. The maintenance facility for Alternative D-4 is located on the upland area near the north edge of the State Park property (same location as Alternative D-3). Alternative D-4 would require an easement from the State of Wisconsin for the entrance road and maintenance facility located within the State Park property.

Alternative D-5

The Alternative D-5 entrance route begins on South 12th Street, traverses the State Park property crossing wetlands, recreational trails, and the Black River near the midline of the Kohler Property. The maintenance facility is located in old field and degraded [REDACTED] of the entrance route. This alternative would require an easement from the State of Wisconsin for the entrance road and maintenance facility located within the State Park property.

Alternative D-6

Alternative D-6 begins on Beach Park Lane at the State Park property entrance, and travels north adjacent to and within portions of the east side of the Black River floodplain to the midline of the Kohler Property. Alternative D-6 does not impact State Park property recreational trails/areas, as the entrance route and maintenance facility are located in an area of the State Park property designated solely for park maintenance operations.

The maintenance facility is located east of the entrance route in the State Park property not typically utilized by the general public. This alternative would require an easement from the

State of Wisconsin for the entrance road and maintenance facility located within the south portion of State Park property.

Alternative D-7

Alternative D-7 begins at Timberlake Road located north of the existing Kohler Property. This alternative utilizes Kohler Property and requires no easement for use of State Park property. The road travels south within the Black River floodplain to the midline of the Kohler Property before turning east. The maintenance building is located to the furthest extent north on uplands within the Kohler Property in close proximity to the burial mounds. Alternative D-7 also routes guest and maintenance traffic through several residential neighborhoods.

Alternative E (Preferred Alternative)

Alternative E reduces the course layout footprint within the Kohler Property, minimizing environmental impacts to the extent practicable. This alternative relocates an approximately five-acre irrigation pond at the north portion of the Kohler Property out of the wetland complex near the Black River. The Alternative E entrance route and maintenance facility locations represent the least impact to wetlands, cultural resources, floodplain impacts, and avoid impacts to recreational areas of the State Park.

The Alternative E entrance route begins on Beach Park Lane at the existing State Park entrance, and travels north within portions of the east side of the Black River floodplain. The entrance route turns east at the Kohler Property and continues northeast. State Park recreational trails/areas are not impacted, as the entrance route and maintenance facility location would be located in an area of the park not typically utilized by the public. The maintenance facility is located east of the entrance route within the State Park property. Alternative E would require an approximate 4 acre easement from the State of Wisconsin for the entrance road and maintenance facility located within the south portion of State Park property.

2.5 CONSTRUCTION SEQUENCE AND SCHEDULE

2.5.1 Methods

Construction of the golf course is expected to begin with selective tree removal followed by phased construction of several holes simultaneously. It is expected that nine holes will be constructed and stabilized each year and that the overall construction process will take approximately 2 years.

Erosion and sediment control implemented during construction shall comply with the guidelines and requirements set forth in Wisc. Admin. Code Section NR 216, NR 151, and the WDNR Runoff Management Performance Standards. Technical Standards published by the WDNR shall also be utilized to implement the required performance standards. The methods and types of erosion control will be dependent on the location and type of work. All sediment control measures shall be adjusted to meet field conditions at the time of construction, and installed prior to any grading or ground disturbance.

2.6 EMISSIONS AND DISCHARGES

2.6.1 Air

Construction equipment including trucks, excavators, and bulldozers will be used to construct the Project. To reduce potential noise impact, construction equipment shall be operated in compliance with all applicable local, state and federal laws and regulations relating to noise

levels permissible within and adjacent to the Project. All motorized construction equipment will be required to have mufflers constructed in accordance with the equipment manufacturer's specifications or a system of equivalent noise reducing capacity. It will also be required that mufflers and exhaust systems be maintained in good working order, free from leaks or holes.

During normal operation of the golf course, daily traffic is expected to include passenger vehicles, and delivery trucks. Maintenance vehicles, both gas and diesel-fueled, will be used on the golf course.

A preliminary assessment of a typical golf course in the northeastern United States calculated 9,936.8 gallons of fuel (26.9 t Ce/yr) were used in an 8 month period for maintenance (Portness, 2008). In 2014, an 18-hole Kohler golf course used 4,133.6 gallons of gasoline and 3,422.95 gallons of diesel fuel for maintenance vehicles. Similar results are anticipated for the Project. Additionally, emissions and fuel use are minimized through an approximate 5 year capital equipment replacement program, which purchases new equipment with current air emission regulations and fuel use efficiencies. Bartlett et al. (2011), reported golf courses with a high percentage of trees would have a net carbon sequestration.

2.6.2 Hazardous Materials

The storage and handling of hazardous materials will be in accordance with all state and federal laws and regulations. Kohler does not anticipate the use or storage of materials that are not currently handled in the operation of its existing golf courses. Kohler has never been cited for environmental violations at its existing golf courses.

A fuel island located adjacent to the maintenance facility will consist of double lined, aboveground tanks with secondary containment. Safety bollards will be installed around the perimeter of the tanks and spill response kits readily available.

Pest management materials will be stored in an IPM control center. The IPM control center is a dedicated secure structure for the storage and mixing of pest control products. Spray equipment is stored and maintained within the control center and drainage occurs via a closed loop system with all materials being recycled and reused for their approved use per the product label.

2.7 MAPS, PLANS AND OTHER DESCRIPTIVE MATERIAL

3.0 AFFECTED ENVIRONMENT

3.1 PHYSICAL ENVIRONMENT

3.1.1 Topography

The topography of the Kohler Property is nearly level to gently rolling with elevations ranging from approximately 582 feet above mean sea level (msl) to 595 feet above msl (Figure 1). The water level associated with Lake Michigan is approximately 580 feet above mean sea level (msl), and the base of the dunes is at 585 feet above msl and varies based on regional precipitation. The dune elevations rise from approximately 585 feet above msl to 595 feet above msl. Inland from the dunes, the land undulates between approximately 585 and 595 feet above msl. The Black River and its riparian wetlands are located approximately 584 feet above msl on the west limits of the Kohler Property.

3.1.2 Soils

The Kohler Property is dominated by sand and muck soils (Figure 5). Sand beaches along the lakeshore are bordered by sand dunes approximately 10 feet high. Soils along the Black River and riparian wetlands include Adrian, Palms and Houghton mucks. The remainder of the Property is mapped as Granby loamy fine sand, Oakville loamy fine sand, and Sisson very fine sandy loam. These three soil units have sandy B and C layers. The Adrian, Palms and Houghton mucks and Granby loamy fine sand units are rated hydric by the Natural Resources Conservation Service (NRCS), while the Oakville and Sisson units are not hydric.

3.1.3 Ground Water

A field study was completed to confirm the geological and hydrogeological characteristics of the Kohler Property. Ten wells were constructed at depths ranging from 25 to 500 feet. Based upon the well logs, dolomite bedrock begins approximately 120 feet below land surface (bls) and extends to a depth of approximately 500 feet bls. The bedrock is overlain with a confining layer of up to 90 feet of clay which is overlain by a layer of sand to the land surface.

Well monitoring and pump tests identified two separate aquifers on the Kohler Property. The shallow aquifer is located within the surficial sand layers between three feet bls to the underlying lacustrine clay. The shallow aquifer is hydraulically separated by the underlying clay deposit from the deep aquifer. The deep aquifer is located within the dolomite bedrock. The bedrock aquifer is artesian in nature and water elevations collected from wells screened within the bedrock aquifer were at the ground surface or, in some cases, overflowing the well casing.

While golf course irrigation is not anticipated to adversely impact the surrounding neighborhood, Kohler will develop a program with the Town of Wilson to mitigate potential impacts to adjacent private water supply wells, similar to the program that was successfully implemented at Whistling Straits.

3.1.4 Surface Water

The Project is located in the Black River watershed, a sub-watershed of the Sheboygan River watershed. The Black River originates near the Village of Oostburg, and flows east and north through agricultural land to the State Park and forms the western boundary of the Kohler Property. The Black River discharges into Lake Michigan within the City of Sheboygan approximately 1.25 miles north of the Kohler Property. In general, the bottom substrate consists

of sand, and the riparian buffer is mainly wetlands and woodlands. An unnamed tributary flows from South 12th Street in the northwest corner of the State Park property into the Black River.

Water quality in the Black River is poor (Galarneau, 2001). Primary land use in the watershed is agricultural lands. Residential areas are found in the upper and lower reaches near the Village of Oostburg and the City of Sheboygan. Polluted runoff and excessive sedimentation from agricultural land contributes to poor habitat for fish, macroinvertebrates and periphyton. In addition, the headwaters receive wastewater discharge from the Oostburg WWTP.

A water quality assessment was completed for a one-year period from October 2010 through September 2011 near Indian Mound Road; water samples were tested for nitrogen, conductivity, pH, dissolved oxygen, and total phosphorus (WDNR, 2014). Results were within a normal, expected range for flowing systems in Wisconsin except for total phosphorus. The current NR102 standard for total phosphorus in streams is a maximum of 75 ug/L. Water bodies with levels above this can be considered impaired. The sample results averaged 279 ug/L, over 3 times the maximum standard. The Black River is proposed to be listed on the 303(d) Impaired Waters List based on a degraded biological community due to high Total Phosphorus (WDNR, 2014b).

The Kohler Property is adjacent to Lake Michigan. The ordinary high water mark (OHWM) is currently defined as 582.7 feet above msl. The shoreline in this area consists of sand beaches and adjacent dunes.

3.1.5 Floodplain

The west limits of the Kohler Property follows the centerline of the Black River. The Black River floodplain has been evaluated for this Project from its confluence with Lake Michigan to Beach Park Road (the main entrance to Kohler-Andrae State Park). According to the Flood Insurance Study for Sheboygan County published by the Federal Emergency Management Agency (FEMA) in 2009, the Black River has a tributary area of 18.3 square miles and a peak discharge of 2,500 cubic feet per second during the 100-year flood event. The Black River flows from south to north and has a 100-year flood event elevation of 589.48 feet above msl at the southern Project limits and decreases to 588.65 above msl when it reaches the north Project limits (Figure 6).

Under normal conditions, this segment of the Black River is a narrow stream that is less than 25 feet wide and five feet deep. It has an approximate normal water surface elevation of 582.00 feet above msl and is bordered on both sides by a wide, level riparian wetland complex with a width that ranges from approximately 300 feet to 1,300 feet.

3.1.6 Air

According to the U.S. Environmental Protection Agency (EPA), Sheboygan County is identified as a "nonattainment" area for ground-level ozone. This area does not meet the EPA's 2008 8-hour ozone national air quality standard (75 parts per billion; EPA 2014). Sheboygan County meets all of the other national air quality standards, including sulfur dioxide, carbon dioxide, and particulates.

3.2 BIOLOGICAL ENVIRONMENT

The Kohler Property and State Park property contain a diverse assemblage of natural plant communities. Vegetation sampling efforts in 2014 recorded 288 plant species and mapped thirteen plant communities on the Kohler Property and State Park property (Stantec, 2014b). Figure 7 shows the plant community locations.

3.2.1 Terrestrial Habitat

The Kohler Property and State Park property contain several terrestrial plant communities. The beach, dune, and ridge and swale communities are found near the Lake Michigan lakeshore, while the northern dry forest/pine plantation, [REDACTED] northern dry forest and old field are found further inland.

The beach community occurs in the narrow band adjacent to Lake Michigan, and is comprised of two zones: the lower beach and the upper beach. The lower beach community is directly affected by wave action and is characterized by a lack of perennial vegetation cover, the presence of drift, and the occurrence of annuals, including [REDACTED]. This community is affected by fluctuating lake levels and waves associated with storm events. The upper beach includes a zone elevated several feet above the beach that is stabilized by perennial vegetation, including grasses, willows (*Salix* spp.) and cottonwood (*Populus deltoides*).

The dune community is the dominant plant community along the lakeshore above the normal water level. This community is characterized by xeric conditions, little to no soil development, and substrate consisting of dry sand. The landforms consist of windblown dunes up to approximately 10 feet in height. The dunes are partially stabilized by herbaceous vegetation, including perennial grasses. Scattered shrubs include common and creeping junipers (*Juniperus* spp.). Areas of unstabilized sand provide habitat for annual dune species, including [REDACTED]. These populations are found along the Kohler Property lakeshore.

The forested dune community occurs on older stabilized dunes to the west of the dune community. The forested dunes are characterized by a relatively high cover of woody vegetation, including an understory of juniper species and perennial graminoids and forbs; and a canopy of trees dominated by red pine (*Pinus resinosa*). Soil development is poor, with the substrate consisting of sand. Notable plant species observed in this community include white camas (*Zigadenus elegans* subsp. *glaucus*) [REDACTED].

The majority of the Project west of the lakeshore and east of the Black River, consists of a northern forest complex on sandy upland. The topography is gently rolling, with longitudinal ridges running generally north-south, parallel to the lakeshore. This area has variable microtopography and vegetation ranging from dry mesic to mesic. The forest canopy is mature with approximately 75 to 100 percent cover on average. Numerous trees throughout the forest habitat have been blown over from the lakeshore winds and poor soil stability. Canopy dominants include white pine (*Pinus strobus*), red oak (*Quercus rubra*) and sugar maple (*Acer saccharum*). Understory vegetation is consistent with [REDACTED] groundlayer, with dominant species including Pennsylvania sedge (*Carex pensylvanica*) and clubmoss (*Lycopodium obscurum*). The forest canopy and vegetation integrity is higher toward the west, and the presence of weedy and invasive species, especially Japanese barberry (*Berberis thunbergii*) is more pronounced toward the east. The understory is open, with a lack of tree saplings, showing evidence of significant deer browse in this community. No rare species were noted within this community.

Degraded [REDACTED] occurs between the old field and degraded hardwood swamp on the State Park property. This community is an early successional forest resulting from recent natural establishment of pioneer forest species within an old field. Canopy dominants include black cherry (*Prunus serotina*), green ash (*Fraxinus pennsylvanica*), and

paper birch (*Betula papyrifera*). The understory is brushy with blackberry (*Rubus allegheniensis*) and invasive species such as bush honeysuckle (*Lonicera tartarica*), multiflora rose (*Rosa multiflora*), and common buckthorn (*Rhamnus cathartica*). No rare species were noted within this community.

The pine plantation occurs on an extensive area of the southwest portion of the Kohler Property, on dry uplands. The canopy is dominated by a mature stand of planted red pine, with a lesser component of white pine and Norway spruce (*Picea abies*). The groundlayer consists of [REDACTED] herbaceous species with areas of dense invasive Japanese Barberry which forms an impenetrable thorny tangle. Pockets of open canopy occur within the pine plantation that are consistent with dune or forested dune vegetation. No rare species were noted within this community.

A section of the southeast portion of the Kohler Property is composed of northern dry forest, on irregular, rolling terrain composed of stabilized sand dunes. The vegetation is characterized by an open tree canopy of less than 50 percent coverage, with canopy dominants including white pine and paper birch. The groundlayer is dominated by Pennsylvania sedge and common juniper. No rare species were noted within this community.

3.2.2 Aquatic Habitat

The Black River is classified as a limited forage fishery. Fish sampling done in 2000 downstream of CTH KK at river mile 7.5 identified six species of fish; all but one rated tolerant or very tolerant to poor water quality (Galarnau, 2001). Macroinvertebrate sampling upstream of CTH KK in 2010 found 26 species indicating poor water quality and a likelihood of significant organic pollution (WDNR, 2014a). Six native aquatic plant species were observed within the Black River channel, including typical emergent, floating and submerged species found throughout the region. There are no known occurrences of rare aquatic species associated with this segment of the Black River.

3.2.3 Wetland Habitat

Wetlands on both the Kohler Property and State Park property were delineated by Jeff Kraemer of Stantec, a WDNR-approved Assured Wetland Delineator. The delineation was completed in September and October of 2014. WDNR and USACE staff completed a field review and approved the assured delineation approach on October 17, 2014. The proposed access road through the State Park property south of the Kohler Property avoids the wetlands indicated by WWI (Figure 5) and as delineated by WDNR staff in 2013.

The delineation identified 81 wetlands on the Kohler and State Park property, ranging from small pocket wetlands to an extensive riparian wetland complex associated with the Black River (Figure 6). On the east limits of the Kohler Property, [REDACTED] and ridge and swale wetlands (5.24 acres) exist within pockets and swales between the dunes, parallel to the shoreline. On the west limits of the Kohler Property and extending onto the State Park property, an [REDACTED] along the Black River and tributary corridors (118.18 acres).

Wetland functional values were assessed using the Wisconsin WDNR Rapid Assessment Methodology for the nine wetland community types identified (Figure 7). Three wetland types were identified as having degraded conditions. Six wetland types were identified as high functional value. The wetland functional assessments are available in the Stantec Wetland Delineation Report (Stantec, 2015).

_____ occurs in concave swale landforms parallel to the lakeshore, located between elevated dunes. _____ are found in several locations in the southeast corner of the Kohler Property, approximately 200 feet from the Lake Michigan shoreline. This community type is characterized by substantial tree canopy, notably by red pine. Species composition includes a mix of hydrophytic and non-hydrophytic vegetation. These wetlands are characterized by seasonally saturated soil, and normally dry out later in the growing season. _____

The ridge and swale wetland community occurs in the upland forest complex, within swales parallel to Lake Michigan. These wetlands consist of a mix of wet meadow vegetation, with lesser components of forested wetland and _____. They include a variety of conditions from exposed to shaded, year-round to seasonal saturation, and within linear swales and isolated depressions. Dominant vegetation consists of bluejoint grass (*Calamagrostis canadensis*), stinging nettle (*Urtica dioica*), reed canary grass (*Phalaris arundinacea*), and tussock sedge (*Carex stricta*). Occasional green ash (*Fraxinus pennsylvanica*) trees occur within this wetland type. Areas of tag alder (*Alnus incana*) occur within this wetland type, forming pockets of _____. No rare species were noted within this community. _____

The _____ forms extensive areas within the Black River floodplain and tributary stream. The community is characterized by the dominant shrub species, tag alder, and a perennially saturated substrate. Occasional trees of green and black ash (*Fraxinus nigra*) occur within the _____ but do not exceed 30 percent canopy. Common groundlayer species include forget me not (*Myosotis scorpioides*), water horehound (*Lycopus uniflorus*), and reed canary grass. Areas of degraded _____ occur on the northwest portion of the State Park property and are dominated by non-native and invasive herbaceous species including garlic mustard (*Alliaria petiolata*), dame's rocket (*Hesperis matronalis*), and forget-me-not. No rare species were noted within this community.

The wet meadow community occurs within the Black River floodplain, along the river banks, sometimes forming extensive corridors. The wet meadow consists of two types: high quality wet meadow consisting predominantly of native sedges and grasses; and degraded wet meadow that is dominated by reed canary grass. Common species within the wet meadow include bluejoint grass, lake sedge (*Carex lacustris*), broad-leaved cat-tail (*Typha latifolia*), swamp milkweed (*Asclepias incarnata*), water horehound, and wild mint (*Mentha arvensis*). Degraded wet meadow occurs along the Black River corridor and in wetland locations on the State Park property. This community is dominated by reed canary grass, and may have isolated trees and shrubs scattered within its mapped area. No rare species were noted within this community.

The hardwood swamp community forms extensive stands within the Black River floodplain, and also smaller areas within isolated depressions, and along tributary streams. The community is characterized by a tree canopy dominated by green ash and black ash. Trees in this community have been blown over from the lakeshore winds, high water table and poor soil stability. The understory varies from brushy to relatively open, with tag alder often forming a shrub layer. Common ground layer species include bottomland aster (*Symphotrichum ontarionis*), water horehound, white avens (*Geum candense*), and bristly buttercup (*Ranunculus hispidus*). Degraded hardwood swamp areas were also observed with a predominance of invasive shrub species and garlic mustard. No rare species were noted within this community.

The seepage slope hardwood swamp community occurs in narrow bands along the upslope edge of wetlands on either side of the Black River, in the transition zone from hardwood swamp

to [REDACTED] The community is characterized by a mature tree canopy of yellow birch (*Betula alleghaniensis*), green ash, beech (*Fagus grandifolia*), sugar maple, and red maple (*Acer rubrum*), and an open understory with lady fern (*Aspidium angustum*), skunk cabbage (*Symplocarpus foetidus*), bristly buttercup, woodreed (*Cinna arundinacea*), ostrich fern (*Matteuccia struthiopteris*), and sensitive fern (*Onoclea sensibilis*). The community occurs on a gradually sloping landscape position, somewhat elevated above the Black River floodplain and is characterized by groundwater discharge. The trees in this community show morphological adaptations, such as buttresses and shallow roots, as a response to shallow water table. No rare species were noted within this community.

3.2.4 Fauna

Incidental wildlife observations were recorded during on-site biological survey events. Raptor and [REDACTED] surveys were also completed for this Project. Table 3-1 lists the wildlife observed, excluding threatened and endangered species which are summarized in biological survey reports provided under separate cover.

Table 3-1. 2014 Wildlife Observations on the Kohler and State Park Properties

| SCIENTIFIC NAME | COMMON NAME |
|-------------------------------|-------------------------------|
| <i>Pseudacris crucifer</i> | Spring Peeper |
| <i>Lithobates sylvaticus</i> | Wood frog |
| <i>Ambystoma laterale</i> | Blue-spotted salamander |
| <i>Plethodon cinereus</i> | Eastern red-backed salamander |
| <i>Chelydra serpentina</i> | Snapping turtle |
| <i>Thamnophis sirtalis</i> | Common garter snake |
| <i>Odocoileus virginianus</i> | White-tailed deer |
| [REDACTED] | [REDACTED] |
| <i>Dryocopus pileatus</i> | Pileated woodpecker |
| <i>Poecile atricapillus</i> | Black-capped chickadee |
| <i>Strix varia</i> | Barred owl |
| <i>Accipiter cooperii</i> | Cooper's hawk |
| <i>Buteo jamaicensis</i> | Red-tailed hawk |
| <i>Bubo virginianus</i> | Great Horned Owl |

The 2013 Christmas Bird Count for Sheboygan noted 50 species, and the Wisconsin Breeding Bird Atlas lists 41 probable and 15 confirmed species for the Sheboygan South survey area.

The amphibian species observed are typical woodland dwellers. The red-backed salamander (*Plethodon cinereus*) uses wooded upland habitats whereas the blue-spotted salamander (*Ambystoma laterale*), the spring peeper (*Pseudacris crucifer*), and the wood frog (*Lithobates sylvaticus*) depend on wetlands for breeding and wooded uplands for foraging and hibernation.

3.2.5 Threatened, Endangered, and Rare Species

Kohler submitted an Endangered Resources Review request to WDNR on August 26, 2014, and to the USFWS on October 3, 2014. Several species of concern were identified as potentially occurring on the Kohler Property and State Park property. Extensive surveys for species of

concern were conducted on the property between 2011 and 2014. When species of concern were observed on-site, their locations were mapped using a sub-meter accuracy Global Positioning System (GPS) device. Additional results from the [REDACTED] and plant surveys are described in the Stantec Technical Memo Botanical Survey (Stantec, 2014b) and the Stantec Technical Memo [REDACTED] Surveys (Stantec, 2014c).

The surveys encountered no evidence of active or historical [REDACTED] on the Property. Surveys encountered the presence of the [REDACTED] in areas outside of proposed development along the Lake Michigan shoreline. The avoidance of the [REDACTED] and its habitat will also protect [REDACTED] which were not observed but are known to occupy similar habitat.

Populations of [REDACTED] were observed on the Kohler Property with the vast majority occurring in areas outside of proposed development. The potential for minor impacts from the project exists. Although State threatened, endangered, and special concern plants are not protected on private property, Kohler will work with the WDNR to develop mitigation, such as transplanting individual plants to suitable habitat or establishing new populations in suitable areas.

3.2.6 Invasive Plant Species

Invasive plant species, including species listed as Restricted under Wisconsin's Invasive Species Rule (NR 40) were found throughout the Kohler Property and State Park property, as shown on Figure 8. Japanese barberry was widespread in terrestrial habitats, ranging from 70 percent cover in the forests near the southern border of the Properties, to 5 to 10 percent cover throughout the majority of the [REDACTED] forest on the Kohler Property. Reed canary grass was widespread throughout the degraded wet meadow and [REDACTED] associated with the Black River, ranging from 5 to 20 percent cover. Multiflora rose was found throughout the degraded hardwood swamp on the State Park property. Japanese knotweed (*Polygonum cuspidatum*) was found in a localized area near the northwest corner of the State Park property. Other invasive species included bush honeysuckle, garlic mustard, and dame's rocket. Purple loosestrife (*Lythrum salicaria*) was not observed.

3.3 CULTURAL ENVIRONMENT

3.3.1 Land Use

The Kohler Property is undeveloped and has been privately owned by Kohler for more than 75 years. The Property's land use is governed by the Town of Wilson. The Kohler Property and the State Park property are zoned P-1 Parks and Recreation. Golf courses are allowable in the P-1 zoning as conditional uses, and an application for a conditional use permit has been submitted to the Town of Wilson. The neighborhoods to the north and west are zoned R-1 Single Family Residential, while the properties to the southwest are zoned A-2 Agricultural. The State Park property to the south is also zoned P-1 Parks and Recreation (Figure 4).

Kohler originally acquired a total of approximately 468 acres in the vicinity during the 1930's. In 1965, 221 acres were donated by Kohler to the State of Wisconsin for the creation of the John Michael Kohler State Park. The remaining 247-acre parcel was also leased to the State in 1965 for a 10-year period.

The State Park borders the Kohler Property to the south and west (Figure 3). The Kohler Park Dunes State Natural Area is contained within the State Park, bordering the lakeshore.

Another 18-hole public golf course, Riverdale Country Club, is located approximately one-half mile west of the Kohler Property, on the west side of 12th Street. Riverdale has co-existed within one-mile of Lake Michigan, along a tributary to the Black River and surrounded by increasing numbers of residential and agricultural neighbors since its opening in 1929.

The Town of Wilson owns a parcel of conservation property adjacent to the northern boundary of the Kohler Property. The Robert Balzer and Ruth Balzer-Schmitt Wilderness Park is a mesic forest dominated by white pine, with secondary dominants of oaks, maples, birch and beech.

Kohler is requesting an easement from the State of Wisconsin for approximately 4 acres of State Park property adjacent to the existing State Park entrance road and maintenance facility. This area of the State Park property is not typically utilized by the public and, therefore, avoids impacts to recreational areas of the State Park.

Kohler has had discussions with representatives of the adjacent Timberlake Subdivision regarding an easement that would allow pedestrian lake access. In connection with developing the golf course, Kohler would allow such access in a manner that does not interfere with the golf course operation.

3.3.2 Traffic

A traffic study was completed to determine the traffic impacts of the proposed golf course (Excel, 2014b). The State of Wisconsin rates the functionality of intersection movements based upon their Level of Service (LOS). In 2012, the State Park had the fifth highest number of visitors (418,373) of all the Wisconsin State Parks (State of Wisconsin, 2013). The LOS for an intersection or traffic movement is calculated in a range from A to F. LOS D is the minimum acceptable value.

The traffic study concludes that all proposed traffic movements at the intersection of CTH V and Beach Park Road will operate at a LOS B or better. The study also shows that all movements at the proposed golf course entrance location to Beach Park Road will operate at LOS A. In both cases, the LOS significantly exceeds the minimum acceptable value. The Level of Service calculations were based upon the existing road intersection configuration. Therefore, no significant improvements were required as a result of the proposed golf course traffic.

To improve circulation, Kohler is proposing to modify the State Park entrance area by adding a roundabout. Two lanes would be dedicated for entry to State Park visitors while golf course and exiting State Park traffic would be routed through the roundabout. Kohler would fund the entire cost of the enhancements.

3.3.3 Socio-economic

Recreation and Tourism

In 2000, Sheboygan County was ranked 7th of golf destinations in the world. This is largely due to the four golf courses developed by Kohler and designed by Pete Dye – Whistling Straits and Blackwolf Run. Blackwolf Run consists of the River Course and the Meadow Valleys Course.

Whistling Straits consists of the Straits Course and the Irish Course. All four courses are ranked in the top 100 public golf course list in Golf Digest Magazine's 2015/2016 issue (Whitten, 2015). The Straits course was ranked 4th in the U.S. An estimated 40,000 visitors play 100,000 rounds in Sheboygan County each year (SB Friedman, 2015).

Sheboygan County contains multiple trail systems with various uses including: hiking, cycling, skiing, and snowmobiling. The county itself maintains about 228 miles of public snowmobiling Trails (Sheboygan County, 2015). Other popular trails include the Old Plank Road Trail, Interurban trail, and the newly constructed Shoreland 400 Rail Trail. The Project site itself contains multiple primitive trails which historically have been used by area residents. These trails have provided recreational opportunities for many years but are currently restricted from public use.

Lake Michigan and a number of inland lakes and county parks located within Sheboygan County provide a variety of recreational activities such as: fishing, boating, bird watching, swimming, canoeing, and kayaking. While the county only maintains six public access areas, there are a number of access areas maintained by other jurisdictions (Sheboygan County, 2015). Lake Michigan provides significant tourist opportunities mostly in the form of sportfishing. Lake Michigan is a prime destination for open water trout and salmon fishing. Sheboygan County hosts 10 charter fishing companies.

In addition to the lakes, Sheboygan County contains parks and natural areas such as Gerber Lake Wildlife Area, Esslingen Park, Roy Sebald Sheboygan River Natural Area, and Amsterdam Dunes. Amsterdam Dunes includes a 333 acre preserve along Lake Michigan and is also being developed as a wetland mitigation bank by Sheboygan County. These parks and natural areas along with the State Park provide the community and tourists with significant outdoor opportunities.

Employment, Labor Force, and Income

According to the 2010 census (U.S. Census, 2010), the population of employed civilian citizens over the age of 16 in the Town of Wilson, Wisconsin was 1,797 (Table 3-3). Median household income is also greater in Wilson than Wisconsin or the U.S. (\$83,311, \$52,413, and \$53,046 respectively). Employment in the Town of Wilson, City of Sheboygan, and Sheboygan County is predominantly in the manufacturing sector (greater than 30 percent). Educational and health care sectors employ greater than 15 percent of the workforce followed by the retail sector (approximately 10 percent).

Table 3-3. Employment and Income Comparison (2010)

| LOCATION | POPULATION | CIVILIAN LABOR FORCE | MEDIAN HOUSEHOLD INCOME ¹ |
|-------------------|-------------|----------------------|--------------------------------------|
| Town of Wilson | 3,330 | 1,797 | \$83,311 |
| City of Sheboygan | 49,288 | 26,873 | \$43,533 |
| Sheboygan County | 115,507 | 28,131 | \$52,920 |
| Wisconsin | 5,686,986 | 2,872,104 | \$52,413 |
| United States | 308,745,538 | 138,668,798 | \$53,046 |

¹2010 Census data not available 2009-2013 American Community Survey 5-year estimates used for comparison

Source: U.S. Census Bureau 2010 and 2013 American Community Survey

3.3.4 Historical and Archaeological

An archaeological study began on the Kohler Property in Summer of 2014 including a visual inspection, shovel tests (10 meter interval), geomorphology investigations, and test excavation pits.

Burial mounds are known to exist near the northwest corner of the Kohler Property and therefore golf course development in this area has been avoided. No additional human remains or burial mounds were discovered during the 2014 survey.

The archaeological study is scheduled to resume in spring of 2015 dependent on weather. Consultation meetings with the WDNR, USACE, and the SHPO are planned upon completion of the study.

3.3.5 Visual and Aesthetic

The Kohler Property is dominated by two scenery types within the gently rolling topography: closed canopy forest and the dunes/lakeshore area. The dunes are vegetated with a fringe of tall trees, ground-hugging junipers, and low dune grasses, allowing a clear, long view of Lake Michigan. The dunes and the lakeshore include areas of non-vegetated and partially vegetated sand. The forest transitions to a pine plantation on the south limits of the Kohler Property, and into an [REDACTED] along the Black River which is dominated by tall shrubs and thick herbaceous vegetation.

The Kohler Property is undeveloped and does not contain structures. Adjacent buildings and fencing, constructed by neighboring property owners along the north and south property lines, are visible on the Property's perimeter. Access on the property is limited to private walking trails.

The lakeshore portion of the Kohler Property has forests and dune areas. The area is primarily visible from Lake Michigan and from the adjoining residential and State Park property. The Property has limited visibility from the west.

Kohler's golf course design philosophy is not to compromise the property's natural features but instead incorporate them with minimalist design intended to highlight the natural contours, native flora and fauna, and maintain the natural lakeshore and dune communities. Development of a golf course will preserve enhanced natural vistas, free from significant structures, for the foreseeable future.

3.4 OTHER SPECIAL RESOURCES

Coastal management in the Great Lakes region is a Federal-State partnership established by the 1972 Coastal Zone Management Act (CZMA). Administered by the National Oceanic and Atmospheric Administration (NOAA), the program provides States financial and technical assistance to develop and implement their own coastal zone management programs. The Wisconsin Coastal Management Program is administered by the Department of Administration (DOA), Bureau of Intergovernmental Relations. According to NOAA, Wisconsin's coastal zone consists of 15 lakefront counties and approximately 820 linear miles of shoreline.

According to the WDNR, the Sheboygan County lakeshore is part of the Central Lake Michigan Coastal Ecological Landscape which extends from Milwaukee County north to Door County. The Kohler Park Dunes State Natural Area, located within the State Park property, is part of this regional landscape. The State Natural area consists of a linear forest zone along Lake Michigan that contains a mixed pine-hardwoods dune forest community dominated with white pine, red

oak, white birch, beech, and sugar maple. This is the largest dune complex on Wisconsin's western shore of Lake Michigan and provides habitat for species associated with the Great Lakes shorelines.

The Kohler Property is within the Harrington Beach-Kohler-Andrae Lakeshore Migration Corridor, an important bird area (IBA). This migration corridor extends from Sheboygan south to Port Washington in Ozaukee County. It encompasses Harrington Beach and Kohler-Andrae State Parks, Cedar Grove Hawk Research Station State Natural Area, and the Forest Beach Migratory Preserve. This IBA contains a variety of habitats including open Lake Michigan waters, sand beach, cool-season grasslands, upland deciduous forest, lowland forest of white cedar and black ash, and shrublands.

Many birds utilize this IBA as migratory stopover and wintering habitat. In winter the open waters host large rafts of diving ducks such as red-breasted merganser (*Mergus serrator*), bufflehead (*Bucephala albeola*), and common goldeneye (*Bucephala clangula*), as well as loons (*Gavia* spp.) and grebes (*Podiceps* spp.). Shorebirds are found on the sandy beaches and a wide variety of landbirds use the woodlands and shrubby areas in both spring and fall. Short-eared owls (*Asio flammeus*) are found occasionally in the grasslands during the winter. Raptors migrate along the lakeshore in large numbers (Wisconsin Bird Conservation Initiative, 2014).

3.5 HAZARDOUS MATERIALS

The WDNR Bureau of Remediation and Redevelopment Tracking System (BRRTS) does not identify any sites on the Kohler or State Park Properties. The nearest identified releases are approximately one mile to the north and west and are both shown to be remediated and closed.

4.0 ENVIRONMENTAL CONSEQUENCES

4.1 PHYSICAL

4.1.1 Topography

The existing topography of the Kohler Property will be retained as much as possible. The Project will not compromise the Property's natural features but instead integrate the existing dunes and natural contours into the course design. Surface water drainage patterns are not anticipated to be altered significantly during construction. Due to the permeable sandy soils, storm water runoff will be managed near the source within biofiltration areas.

4.1.2 Soils

Native soil on the Kohler Property is well suited for construction of a golf course. The native sand requires minimum site grading and overall disturbance will be minimized to the narrow fairway and rough playing areas in contrast to mass grading and importing sand to improve drainage typically required for courses constructed on less permeable soil types. The site construction is intended to balance material use and off-site disposal is not anticipated. Imported soil may include topsoil for turf areas and specialized soil mix for green and tee construction. The remaining trees and vegetation will be protected from soil compaction ensuring they become part of the final golf course design and experience.

4.1.3 Ground Water

As further described in Section 3.1.3, a ground water study was completed to determine the potential impact associated with providing irrigation for the golf course on the neighboring residential wells (Stantec, 2014a). The planned irrigation requirements were based upon the 18-hole historical irrigation volumes used at Kohler's Blackwolf Run and Whistling Straits Golf Course. These courses were chosen for comparison because of their shared conditions and proximity to the Kohler Property. Based upon the historical irrigation information, irrigation system flow rates up to 1,500 (gpm) and long term average volumes of 15,000,000 to 25,000,000 gallons per year can be anticipated. The average pumping volume during the peak months of the last seven years at the Kohler golf courses was 190,000 gallons per day (gpd) per 18-holes, with a peak of 334,000 gallons gpd during the driest months of the 2012 drought. These values were used to analyze the anticipated impact of the irrigation system.

To complete the study, two pump tests were completed to determine the regional ground water elevation drawdown associated with pumping from the bedrock aquifer. The tests were completed utilizing a well located in the southeast corner of the Kohler Property as a pumping well and by monitoring nine additional wells located at varying distances from the pumping well. The pumping well is an 8-inch diameter well with a practical pumping limit of 450 – 500 gpm. Therefore, a 72-hour constant head rate pump test was completed at 450 gpm along with a step drawdown test.

Based upon the pumping test and analysis, it was determined that the drawdown associated with a 72-hour pumping test at 450 gpm does not exceed the allowable drawdown typically provided for in the neighboring wells.

The impact associated with pumping during an average year or a drought year similar to 2012 at 450 gpm is not anticipated to adversely impact the surrounding neighborhood.

The regional wetlands are not anticipated to be impacted by the drawdown associated with the irrigation well. Similarly, any domestic wells installed within the shallow aquifer (such as sand point wells) are not anticipated to be impacted.

In the event that an adjacent well was constructed with less than the typical allowable drawdown, it may become necessary to lower the pump elevation within the existing well casing to provide additional allowable drawdown. Due to the artesian nature of the aquifer and the depth necessary to construct a well within the bedrock aquifer, this is considered a minor modification that would not necessitate additional drilling. Kohler will develop a program with the Town of Wilson to mitigate potential impacts to adjacent private water supply wells. A similar program was successfully implemented at Whistling Straits.

4.1.4 Surface Water

Due to the minimal amount of impervious surface associated with a golf course, along with a commitment to incorporate the existing topographic features and infiltrate 100 percent of the storm water runoff, all as further described in Section 3.1.4 above, there is not expected to be an impact to surface water.

The Project will create a new surface water feature, an approximately 5-acre irrigation pond supplied with water from the bedrock aquifer. The pond will be lined to prevent loss to the sandy soils. This pond is considered a beneficial feature to wildlife and aesthetics, similar to constructed ponds on other Kohler golf courses. The design will consider BMPs to create and protect surface water quality in the pond while fulfilling the role of irrigation storage.

The storm water detention basins may temporarily hold water during large storm events, but will be designed to infiltrate or drain quickly, so no new permanent surface water features will be created as a result of storm water management.

There will be no surface water impacts to the Black River or Lake Michigan, as described in Section 4.2.2.

4.1.5 Floodplain

A floodplain study has been completed to assess the potential impact to the Black River floodplain elevation due to the several small areas of construction for the golf course and the entrance road. The floodplain study was completed using HEC-RAS modeling software. Based upon the analysis, localized nominal increases in the floodplain are expected on the Kohler Property and the State Park property. Based upon the study, floodplain impacts are not expected to affect adjacent properties. The impact varies along the length of the Black River, as detailed in Table 4-1.

Table 4-1. Project Black River Floodplain Changes

| LOCATION | EXISTING FLOODPLAIN ELEVATION (FT) | PROPOSED FLOODPLAIN ELEVATION (FT) | DIFFERENCE (FT) |
|-------------------|------------------------------------|------------------------------------|-----------------|
| Beach Park Road | 589.82 | 589.83 | +0.01 |
| Southern Lot Line | 589.48 | 589.49 | +0.01 |
| Northern Lot Line | 588.65 | 588.65 | +0.00 |

4.1.6 Storm Water

A storm water management plan will be developed for the golf course to meet the Town of Wilson and WDNR storm water requirements as described in Section 2.3.8. In addition to meeting the quantitative runoff requirements, the following procedures will be followed:

- Impervious surfaces will be kept out of protective areas to the maximum extent practicable, generally defined as 75 feet from lakes and 50 feet from wetlands.
- Storm water runoff from parking areas and roadways will be treated for TSS removal prior to infiltration.
- Storm water runoff from fueling and maintenance areas will not be infiltrated. These areas shall have BMPs designed, installed, and maintained to reduce petroleum in the runoff.
- A separation of five feet will be provided from the bottom of any infiltration device collecting storm water from a roadway or parking lot to the seasonal high ground water elevation.
- The Project will not result in a direct discharge of storm water to Lake Michigan, the Black River, or wetlands.
- A separation of one foot will be provided from the bottom of any infiltration device collecting storm water from a roof top to the seasonal high ground water elevation.

Upon completion, the following operations and maintenance procedures will be implemented (Table 4-2).

Table 4-2. Storm Water Operations and Maintenance Procedures

| STORM WATER FACILITY | TYPE OF ACTION |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Lawn and Landscaped Areas | All lawn areas shall be kept clear of any materials that block the flow of storm water. Rills and small gullies shall immediately be filled and reestablished with native vegetation. |
| 2. Swales | All swales showing signs of erosion, scour, or channelization shall be repaired, reinforced, and re-vegetated immediately. All swales shall be repaired to the original plan requirements. |
| 3. Filter Strips (Within Existing Soils) | The area directly over the infiltration areas draining impervious areas shall be regularly inspected for any type of settling or clogging that may take place. Any failed areas showing signs of degradation shall be restored to the original plan requirements. |
| 4. Biofiltration Basin | During the first 2-3 months of establishment, the basin will require, at a minimum, watering on a weekly basis depending on weather. Visual inspections of the basin shall be performed annually at a minimum. Maintenance shall be required when standing water occurs 3 days after a rain event. Maintenance shall consist of the removal of sediment, and a 2 foot undercut. Replace the undercut material with 1/3 topsoil, 1/3 compost, and 1/3 sand. Restoration of plant material shall be by plugging 1 native perennial per square foot, not by seeding. In the spring of each growing year, dead vegetation shall be removed to allow for new growth. At least 2 times during the growing season, the basin will be weeded and additional hardwood mulch shall be added as needed to assist in weed suppression. |
| 5. Catch Basin/Curb Inlet Grates | The grate openings to these structures must be cleared periodically of any clogging or the blocking of storm water flow from getting into the storm water conveyance system of any kind. |
| 6. Catch Basin/Curb Inlet Sumps | Sumps shall visually be inspected every 3 months. Siltation shall be removed and disposed of offsite when the sump depth is within 3 inches of the outlet pipe invert elevation. The removal of siltation should occur a minimum of once per year. |
| 7. Oil/Grease Filter Insert | Maintenance shall be in accordance with the manufacturer's guidelines, which at a minimum shall be 3 inspections per year, 3 cleanings per year, and 1 filter replacement per year. More specifically, debris shall be removed and the filter medium shall be replaced any time the filter medium appears to be 50 percent coated with oil and grease. |
| 8. Record of Maintenance | The operation and maintenance plan shall remain onsite and be available for inspection when requested by Town of Wilson or WDNR. When requested, the owner shall make available for inspection all maintenance records to the department or agent for the life of the system. |

Implementation of the measures described in this section are expected to minimize impacts associated with storm water runoff.

4.1.7 Domestic Wastewater

Domestic wastewater from the club house, cart building, maintenance building and rest stations will be provided via private on-site wastewater treatment systems (POWTS). Based upon soil tests completed, the native sandy soils are suitable for conventional septic systems. The systems will be located adjacent to each structure they serve in locations that topographically provide sufficient separation between the bottom of the system and the shallow groundwater table. There is no adverse impact anticipated as a result of these systems.

4.1.8 Air

The Property is located in a nonattainment area and operation of the golf course is not expected to significantly contribute to long-term increases in air emissions. There is not expected to be a concentration of vehicles associated with daily golf course operations and minimal vehicles will be using the Property during winter months when the golf course is closed.

The Project is expected to have intermittent and temporary air emissions during construction. In the long term, there will be a negligible increase in emissions from staff, guests, delivery and maintenance vehicles. Projected traffic volumes are not expected to impact air quality.

Because the Project is in the planning phases, projected carbon sequestration has not been determined. Selective removal of trees on the Kohler Property will allow the Kohler Property to continue to sequester carbon. Research shows that turfgrass also sequesters carbon (USDA 2003). Carbon equivalent emissions from vehicle fuel use, nitrogen fertilizer manufacture and application, and irrigation pumping lower the carbon sequestration potential of the Project. The carbon balance can be shifted toward net sequestration by retaining woody and native vegetation and investment in course-wide energy efficiency technologies.

4.2 BIOLOGICAL

4.2.1 Terrestrial

Kohler's investigation of terrestrial habit is outlined in Section 3.2.1 above. Construction and operation of the golf course will affect approximately 50 percent of the existing upland plant communities, including [REDACTED] pine plantation, and forested [REDACTED] communities. The existing habitat will be replaced with turfgrass and other site features including an approximately 5 acre irrigation pond which will provide open water habitat that does not currently exist.

The remaining 50 percent of the existing upland habitat will be preserved and remain located predominantly between golf course features, increasing forest edge habitat. The native flora and fauna are essential features of the golf course design and playing experience.

A secondary effect of tree removal may favor encroachment of invasive plant species. Potential indirect impacts may occur from importing soil from off-site sources possibly transporting invasive species. To maintain native habitat, invasive species will be monitored and managed through invasive species control efforts that will restore the remaining habitat to its natural state while likely increasing the biodiversity in these areas.

Potential indirect impacts to terrestrial habitat during operation of the golf course may include foot traffic from golfers. Signage will be incorporated into site operations to minimize traffic in sensitive areas.

4.2.2 Aquatic

There are no anticipated environmental impacts to aquatic resources. The Black River will be buffered from the golf course by the expansive riparian wetlands, and there will be no surface water withdrawals for irrigation. Because of high soil permeability, surface water runoff inputs to surface waters will be minimized.

4.2.3 Wetlands

4.2.3.1 Impacts of Alternative Designs

Kohler's wetland delineation process is described in Section 3.2 above. During project planning, four conceptual course layout and eight entrance alternatives were identified, characterized and evaluated. The course layouts alternatives were considered in order to identify a preferred course design and minimize environmental impacts. The alternatives also include alternate maintenance building locations. The preferred alternative (Alternative E) has the least amount of wetland impacts of the twelve alternatives, minimizes impacts as much as practicable, and completely avoids impacts to recreational areas of the park and burial sites.

Eight entrance routes were investigated to identify a preferred route for guest and operational traffic. All entrance route options are constructible and viable, however the presence of environmental encumbrances and current use result in certain routes being more desirable than others.

Eight maintenance building locations were considered in co-locations with the entrance routes.

Alternative drawings with course layout, entrance routes, and maintenance building locations are provided in Figures 9A-E. The following provides a summary of the consequences and impacts for each alternative design considered for this Project:

Consequences of Alternative A:

The Alternative A proposes a course layout design that contains a footprint within the existing Kohler Property and additional expansion on the State Park property to the south. Alternative A impacts approximately 14 total acres of wetlands including portions of the Black River floodplain and one stream crossing of the Black River. This alternative would require an easement from the State of Wisconsin for the entrance route within the west portion of the State Park and use of State Park property to the south.

The Alternative A course layout design and proposed location of the irrigation pond expands to the northwest within close proximity to the burial mounds and within the Black River floodplain. Hole design near the west extent of the Kohler Property are located within or close proximity to the Black River floodplain. Hole design to the south expands onto State Park property.

The entrance route originates on South 12th Street, and traverses the southern part of the west State Park property. The entrance route crosses several wetland communities before bridging across the Black River onto Kohler Property. The entrance route continues east crossing forested dune before turning northeast and ending at the proposed parking area.

The maintenance building is located in the west central portion of the Kohler Property within a [REDACTED] and northern dry forest (pine plantation). The proposed maintenance building would result in no wetland impacts.

Based on the footprints of the entrance route, course design, maintenance facility and irrigation pond, Alternative A impacts approximately 14 acres of wetland including portions of the Black

River floodplain. The types of wetland that may potentially be impacted include; [REDACTED] wet meadow, degraded wet meadow, hardwood swamp, degraded hardwood swamp, hardwood swamp/forested seep, ridge and swale wetland and [REDACTED]. Alternative A is less desirable due to the amounts of wetland impacts and the amount of State Park property needed for the design.

Consequences of Alternative B-1:

The Alternative B-1 proposes a course layout design that contains the largest proposed footprint within the existing Kohler Property impacting the greatest amount of wetlands (approximately 25 total acres), including portions of the Black River floodplain and one stream crossing of the Black River. This alternative would require an easement from the State of Wisconsin for the entrance route within the west portion of the State Park property.

Alternative B-1 course layout design and proposed location of the irrigation pond expands to the northwest within close proximity to the burial mounds and within the Black River floodplain. Holes near the west extent of the Kohler Property are located within and close proximity to the Black River floodplain.

The entrance route originates on South 12th Street, and traverses the central part of the west State Park property. The entrance route crosses old field and several wetland communities before bridging across the Black River. The entrance route continues east onto Kohler Property, crosses the ridge and swale wetland before ending at the parking area.

The proposed maintenance building is located within a degraded [REDACTED] and degraded hardwood swamp.

Based on the footprints of the entrance route, course design, maintenance facility and irrigation pond, Alternative B-1 impacts the largest amount of wetlands (approximately 26 acres), including portions of the Black River floodplain. The types of wetland that may potentially be impacted include; [REDACTED] wet meadow, degraded wet meadow, hardwood swamp, degraded hardwood swamp, hardwood swamp/forested seep, ridge and swale wetland and [REDACTED]. Alternative B-1 is less desirable due to the amount of wetland impacts and because it would bisect the State Park property and impact the existing recreational trails, creating road/trail crossings.

Consequences of Alternative B-2:

The Alternative B-2 proposes the same course layout design and entrance route as Alternative B-1. The only alterations to Alternative B-2 are the removal of the mound system surrounding the maintenance facility and relocating the turf nursery onto Kohler Property. Alternative B-2 slightly reduces wetland impacts to approximately 24 total acres, including portions of the Black River floodplain. This alternative would require an easement from the State of Wisconsin for the entrance route within the west portion of the State Park property.

Alternative B-2 course layout design and proposed location of the irrigation pond expands to the northwest within close proximity to the burial mounds and within the Black River floodplain. Hole design near the west extent of the Kohler Property are located within and close proximity to the Black River floodplain.

The entrance route originates on South 12th Street, and traverses the central part of the State Park property. The entrance route crosses old field and several wetland communities, as well as recreational trails, before bridging across the Black River. The entrance route continues east onto Kohler Property, crosses ridge and swale wetland before ending at the parking area.

The proposed maintenance building is located in the west central portion of the State Park property located within a degraded [REDACTED] and degraded hardwood swamp.

Based on the footprints of the entrance route, course design, maintenance facility and irrigation pond, Alternative B-2 impacts approximately 24 total acres of wetlands (including portions of the Black River floodplain). The types of wetland that may potentially be impacted include; [REDACTED] wet meadow, degraded wet meadow, hardwood swamp, degraded hardwood swamp, hardwood swamp/forested seep, ridge and swale wetland and [REDACTED]. Alternative B-2 is less desirable due to the amount of wetland impacts and because it would bisect the State Park property and impact the existing recreational trails, creating road/trail crossings.

Consequences of Alternative C:

The Alternative C proposes a course layout design that reduces the footprint within the existing Kohler Property, minimizing wetland impacts. Alternative C impacts approximately 16 total acres of wetlands, including portions of the Black River floodplain, and one stream crossing of the Black River. This alternative would require an easement from the State of Wisconsin for the entrance route within the State Park property.

The Alternative C course layout design relocates the hole located in the northwest corner of the Kohler Property and repositions it further south away from the burial mounds. Holes located within the beach adjacent to Lake Michigan are moved further to the west, [REDACTED]. Holes located to the west adjacent to the Black River floodplain are moved further east, minimizing impacts within the Black River floodplain. Holes designed within the forested dune are relocated, minimizing impacts to sensitive habitats.

This alternative places the entrance route in the same location as Alternatives B-1 and B-2. The entrance route originates on South 12th Street, and traverses the central part of the west State Park property. The entrance route crosses old field and several wetland communities as well as recreational trails before bridging across the Black River. The entrance route continues east onto Kohler Property, crosses ridge and swale wetland before ending at the parking area.

The proposed maintenance building is located in the west central portion of the State Park property located within a degraded [REDACTED] and degraded hardwood swamp. The location of the maintenance building is the same as Alternative B-2.

Based on the footprints of the entrance route, course design, and maintenance facility Alternative C minimizes wetland impacts, totaling approximately 16 acres (including portions of the Black River floodplain). The types of wetland that may potentially be impacted include; [REDACTED] hardwood swamp, degraded hardwood swamp, hardwood swamp/forested seep, ridge and swale wetland and [REDACTED].

[REDACTED] Alternative C is less desirable due to the amount of wetland impacts and because it would bisect the State Park property and impact the existing recreational trails, creating road/trail crossings.

Consequences of Alternative D-1:

The Alternative D-1 proposes a course layout with wetland impacts totaling approximately 18 acres, including portions of the Black River floodplain. This alternative would require an easement from the State of Wisconsin for the entrance route within the west portion of the State Park property.

The entrance route remains on South 12th Street, and traverses the southern part of the west State Park property. The entrance route crosses uplands and several wetland communities as well as recreational trails before bridging across the Black River. The entrance route continues east onto Kohler Property, crosses ridge and swale wetland before ending at the parking area.

The proposed maintenance building is located in the southwestern portion of the State Park property south of the entrance route. The proposed maintenance building is located within an [REDACTED] wet meadow, degraded wet meadow, hardwood swamp and degraded hardwood swamp.

Based on the footprints of the entrance route, course design, and maintenance facility Alternative D-1 contains wetland impacts totaling approximately 18 acres (including portions of the Black River floodplain). The types of wetland that may potentially be impacted include; [REDACTED], wet meadow, degraded wet meadow, hardwood swamp, degraded hardwood swamp, hardwood swamp/forested seep, ridge and swale wetland and [REDACTED]

[REDACTED] Alternative D-1 is less desirable due to the amount of wetland impacts.

Consequences of Alternative D-2:

The Alternative D-2 proposes a course layout design with wetland impacts totaling approximately 14 acres including portions of the Black River floodplain. This alternative would require an easement from the State of Wisconsin for the entrance route within the State Park property.

The entrance route begins on South 12th Street on the north end of the State Park property, traverses through uplands, recreational trails and several wetland communities, and bridges the Black River near the north-south midline of the Kohler Property. The entrance route continues east onto Kohler Property, crosses wetlands before ending at the parking area.

The proposed maintenance building is located in the northwestern portion of the State Park property south of the entrance route. The proposed maintenance building is located within an old field with the entrance road crossing a degraded wet meadow.

Based on the footprints of the entrance route, course design, and maintenance facility Alternative D-2 contains impacts totaling approximately 14 acres (including portions of the Black River floodplain). The types of wetlands that may potentially be impacted include; [REDACTED] degraded [REDACTED] wet meadow, degraded wet meadow, hardwood swamp, degraded hardwood swamp, hardwood swamp/forested seep, ridge and swale wetland and [REDACTED]

[REDACTED] Alternative D-2 is less desirable due to the impacts to the recreational trails on State Park property and the discovery of pre-historic and historic artifacts along the route.

Consequences of Alternative D-3:

The Alternative D-3 proposes a course layout design with wetland impacts totaling approximately 15 acres including portions of the Black River floodplain. This alternative would require an easement from the State of Wisconsin for the entrance route within the State Park property.

The entrance route begins at the intersection of Stahl Road and South 12th Street, in a Kohler owned residential development immediately north of the State Park property; continues straight east crossing the Black River, and then runs south adjacent the Burial mounds to the approximate midline of the Kohler Property. This entrance route traverses uplands and several

wetland communities, continues east onto Kohler Property, and crosses ridge and swale wetland before ending at the parking area.

The proposed maintenance building is located in the north portion of the State Park property south of the entrance route within a pine plantation. The proposed maintenance building would result in no wetland impacts.

Based on the footprints of the entrance route, course design, and maintenance facility Alternative D-3 contains wetland impacts totaling approximately 15 acres (including portions of the Black River floodplain). The types of wetland that may potentially be impacted include; [REDACTED], degraded [REDACTED] wet meadow, degraded wet meadow, hardwood swamp, degraded hardwood swamp, hardwood swamp/forested seep, ridge and swale wetland and [REDACTED]. Alternative D-3 is less desirable due to the route's proximity to burial mounds. The upland area adjacent to the burial mounds is also considered to be an area of archaeological significance.

Consequences of Alternative D-4:

The Alternative D-4 proposes a course layout design with wetland impacts totaling approximately 14 acres including portions of the Black River floodplain. This alternative would require an easement from the State of Wisconsin for the entrance route and a maintenance facility within the State Park property.

The Alternative D-4 entrance route begins at the intersection of Stahl Road and South 12th Street, in a Kohler owned residential development immediately north of the State Park property. Alternative D-4 entrance route diverges from Alternative D-3, and runs southeast across the State Park property, avoiding the Burial mounds, and then crossing the Black River. This entrance route traverses uplands and several wetland communities, continues east onto Kohler Property, and crosses ridge and swale wetland before ending at the parking area.

The proposed maintenance building is located in the north portion of the State Park property north of the entrance route (same location as Alternative D-3) within a pine plantation. The proposed maintenance building would result in no wetland impacts.

Based on the footprints of the entrance route, course design, and maintenance facility Alternative D-4 contains wetland impacts totaling approximately 14 acres (including portions of the Black River floodplain). The types of wetland that may potentially be impacted include; [REDACTED] degraded [REDACTED] wet meadow, degraded wet meadow, hardwood swamp, degraded hardwood swamp, hardwood swamp/forested seep, ridge and swale wetland and [REDACTED]. Alternative D-4 is a viable option, as it originates at an existing intersection, minimizes impacts to recreational trails, and minimizes environmental impacts. However, Alternative D-4 was not selected as the preferred option, as Alternative D-4 does would impact recreational areas on the State Park property.

Consequences of Alternative D-5:

The Alternative D-5 proposes a course layout design with approximately 14 acres including portions of the Black River floodplain. This alternative would require an easement from the State of Wisconsin for the entrance route and maintenance facility within the State Park property.

The Alternative D-5 entrance route begins on South 12th Street, traverses the State Park property through uplands, recreational trails and wetlands, and bridges the Black River near the north-south midline of the Kohler Property. This entrance route traverses old field, degraded [REDACTED] and degraded hardwood swamp, which are dominated by non-native and/or

invasive species. The road crosses hardwood swamp, [REDACTED] and the Black River. The entrance route continues east onto Kohler Property, crossing hardwood swamp/forested seep and ridge and swale wetland before ending at the parking area.

The proposed maintenance building is located in the central portion of the State Park property north of the entrance route. The proposed maintenance building is located on old field and [REDACTED]. The proposed maintenance building would result in no wetland impacts.

Based on the footprints of the entrance route, course design, and maintenance facility Alternative D-5 contains wetland impacts, totaling approximately 14 acres (including portions of the Black River floodplain). The types of wetland that may potentially be impacted include; [REDACTED] hardwood swamp, degraded hardwood swamp, hardwood swamp/forested seep, ridge and swale wetland and [REDACTED]. Alternative D-5 is less desirable as it would bisect the State Park property and impact the existing Black River recreational trails, creating three separate road/trail crossings.

Consequences of Alternative D-6:

The Alternative D-6 proposes a course layout design with wetland impacts totaling approximately 15 acres including portions of the Black River floodplain. This alternative would require an easement from the State of Wisconsin for the entrance route and maintenance facility within the State Park property.

Alternative D-6 begins on Beach Park Lane at the existing State Park entrance, and travels north adjacent and within portions of the east side of the Black River floodplain to the midline of the Kohler Property traversing [REDACTED] hardwood swamp/forested seep, and hardwood swamp. The entrance route turns east crossing a ridge and swale wetland before ending at the parking area.

The maintenance facility is located east of the entrance route on portions of the State Park property not typically utilized by the general public and contains [REDACTED].

[REDACTED] State Park recreational trails/areas are not impacted as the entrance road and the maintenance facility location would be located in an area not typically utilized by the public. Additional benefits to the State Park would be to make utilities not currently available, accessible to the existing State park maintenance facility along with providing a more suitable access road for park maintenance operations.

Based on the footprints of the entrance route, course design, and maintenance facility Alternative D-6 contains wetland impacts, totaling approximately 15 acres (including portions of the Black River floodplain). The types of wetland that may potentially be impacted include; [REDACTED] hardwood swamp, hardwood swamp/forested seep, ridge and swale wetland and [REDACTED]. Alternative D-6 is less desirable due to the size of the wetland impact on Kohler Property associated with this entrance route.

Consequences of Alternative D-7:

The Alternative D-7 proposes a course layout design with wetland impacts totaling approximately 14 acres including portions of the Black River floodplain. This alternative solely utilizes Kohler Property and requires no easement for the use of State of Wisconsin property.

Alternative D-7 begins at Timberlake Road located north of the existing Kohler Property. The road travels south within the Black River floodplain, while crossing [REDACTED] hardwood swamp/forested seep, hardwood swamp, wet meadow and [REDACTED].

4.2.4 Fauna

Kohler's investigation of fauna is described in Section 3.2.4 above. Many wildlife species will naturally disperse during site construction activities to adjacent habitats. Some species will return to utilize available habitat following construction. Certain wildlife species may be directly impacted during and after construction because of habitat loss and their inability to disperse to replacement habitat. Impact to these species is not expected to create a significant effect on regional populations.

Project activities will focus on minimizing impacts to wildlife and improving the unaffected forest habitat. The Project will avoid impacts to [REDACTED]. At least 50 percent of the forest habitat will be retained, and invasive species management, as well as restoration of native trees and shrubs in invasive removal areas, will improve the retained forest habitat.

4.2.5 Threatened and Endangered Species

Significant effort was made during the development of Project alternatives to avoid direct impacts to regulated species as noted in Section 3.2.5 above [REDACTED]. [REDACTED] will be avoided and protected by the Project. [REDACTED] are adjacent to Project features and may experience some minor impacts. Kohler will [REDACTED] and will avoid and minimize impacts to [REDACTED] to the extent practical.

Impacts to State listed plant species, which are not protected on private property, will be minimized to the extent practicable. Kohler will work with WDNR to develop mitigation measures for impacted State listed plant species, such as transplanting individuals to suitable habitat (if tolerated by the species), or establishing new populations in suitable areas. Additionally, Kohler will install educational and "Do Not Disturb" signs in rare species areas, and provide other wayfinding cues to direct traffic away from high quality plant communities. Rare species protection protocols will also be included in staff training for course operators.

4.2.6 Invasive Species

Invasive species exist on the Kohler Property and State Park property (See Section 3.2.6). Although there may be opportunities for invasive species to spread from site disturbance, habitat fragmentation, and soil importation, invasive species control efforts will be employed as part of the Project.

Table 4-4 provides recommendations for the invasive species mapped on the Kohler Property. Management of Japanese barberry is the priority due to its current density, while the other species are a secondary priority, being scattered across the Property. Herbicides will be applied by licensed professional pesticide applicators and in accordance with product labels. Kohler will complete invasive species management and replant native trees, shrubs and groundcover in areas beneficial to the habitat.

The management of invasive species will have a significant, long term positive benefit to the property and biological community. Invasive species removal allows native plant communities to repopulate, significantly enhancing the habitat and promoting increases in native biological and wildlife diversity.

Table 4-4. Invasive Species Management Recommendations

| Species | Plant Community | Recommended Treatment Method(s) and Herbicide (Common Product Name Example) | Timing |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Japanese barberry (<i>Berberis thunbergii</i>) | Northern Dry Forest – Pine Plantation Northern Dry-Mesic Forest Dune and Forested Dune Hardwood Swamp/Forested Seep | Foliar application (Triclopyr) with backpack sprayer or boom sprayer (for dense populations in the Pine Plantation) | When plant is actively growing and fully leafed out |
| | | Forestry mow and conduct foliar application (Triclopyr) with backpack sprayers to resprouts (for dense populations in the Pine Plantation); less potential damage to non-target species and reduces amount of herbicide applied compared to option a. | Mow during the dormant season (fall, winter). Apply herbicide to resprouts when plant is actively growing and fully leafed out the following growing season. |
| | | Cut-stump and treatment (Glyphosate) (feasible for scattered populations) | Conduct any time of year |
| Reed canary grass (<i>Phalaris arundinacea</i>) | Swale Wetland Complex Alder Thicket Wet Meadow – degraded Northern Dry-Mesic Forest | Foliar application (Glyphosate) via backpack sprayer in areas with scattered populations. Control in areas with dense populations is likely not feasible without intensive efforts, reintroduction of native species, and continued management. | Spring (prior to seed production) or fall (may mow first and allow for appropriate regrowth prior to treating) |
| Honeysuckle species (<i>Lonicera</i> spp.) | Interdunal Wetland | Foliar application (Glyphosate) | When plant is actively growing and fully leafed out |
| | | Cut-stump and treatment (Glyphosate) (recommended for medium to large shrubs to reduce overspray) | Conduct any time of year |
| Garlic mustard (<i>Alliaria petiolata</i>) | Northern Dry-Mesic Forest | Foliar application (Glyphosate) via backpack sprayer | Treat rosettes in spring or fall or treat flowering plants |
| Dame's rocket (<i>Hesperis matronalis</i>) | Northern Dry-Mesic Forest Hardwood Swamp/Forested Seep | Foliar application (Glyphosate) via backpack sprayer | Treat rosettes in spring or fall or treat flowering plants |
| Canada thistle (<i>Cirsium arvense</i>) | Northern Dry-Mesic Forest Swale Wetland Complex | Foliar application (Glyphosate) via backpack sprayer | Apply during flower bud to early flowering stage or to rosettes in fall if leaves are green |
| Spotted knapweed (<i>Centaurea stoebe</i>) | Dune | Foliar application (Aminopyralid) via backpack sprayer | Apply to rosettes in the spring or fall, or to plants in the bolting stage |

| Species | Plant Community | Recommended Treatment Method(s) and Herbicide (Common Product Name Example) | Timing |
|----------------------------------------------------|-----------------------------------|-----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Black locust (<i>Robinia pseudoacacia</i>) | Forested Dune | Cut-stump, basal bark, or girdling (Aminopyralid) | Apply any time of year |
| Cypress spurge (<i>Euphorbia cyparissias</i>) | Dune Northern Dry-Mesic Forest | Foliar application (Glyphosate) via backpack sprayer | Apply twice per year, first to plants when seeds are forming and again in fall before a killing frost |

4.2.7 Other

The Kohler Property is dominated by sandy soils with high permeability. This combined with a shallow depth to the surficial groundwater aquifer increases the potential for pesticides and fertilizer to leach into the shallow aquifer. Leaching of pesticides and fertilizers to the aquifer will be minimized through careful implementation of contemporary IPM and irrigation BMPs. See Section 2.3.6 and 2.3.7.

Kohler will operate this golf course in accordance with the latest IPM plan and as recommend by manufacturer's specifications. New IPM practices are being tested and developed on an ongoing basis, and contemporary water and pest management practices reduce environmental impacts significantly compared to twenty years ago (Rossi and Grant, 2009). Precision irrigation management can minimize leaching by scheduling irrigation so that water does not move beyond the active rooting zone. Additionally, careful application of fertilizers at rates that match plant requirements also decreases nitrogen leaching from established turfgrass (Barton and Colmer 2006). Using new pesticide products with lower active ingredient concentrations and lower leaching capabilities reduces the risk of leaching into the groundwater (Kovach et al., 1992).

4.3 CULTURAL

4.3.1 Land Use

The proposed golf course would allow public access to the 247 acre property which is privately owned and currently unavailable to the public. Rezoning of the property is not required as a golf course is allowable within the current zoning of P-1 Parks and Recreation as a conditional use.

In connection with developing the golf course, Kohler would grant a lake access easement for lot owners in the Timberlake Subdivision. This easement will be located in the northeast portion of the Kohler Property and will provide subdivision lot owners direct access to Lake Michigan, which currently does not exist.

4.3.2 Traffic

A study was completed to determine the traffic impacts of the proposed golf course (Excel, 2014b). The State of Wisconsin rates the functionality of intersection movements based upon their Level of Service (LOS). The LOS for an intersection or traffic movement is calculated in a range from A to F. The minimum acceptable value is LOS D.

The traffic study concludes that all proposed traffic movements at the intersection of CTH V and Beach Park Road will operate at a LOS B or better. The study also shows that all movements at the proposed golf course entrance location to Beach Park Road will operate at LOS A. In both cases, the LOS significantly exceeds the minimum acceptable value. The Level of Service calculations were based upon the existing road intersection configuration. Therefore, no additional improvements were recommended as a result of the proposed golf course traffic.

To improve circulation, Kohler is proposing to modify the State Park entrance area by adding a roundabout, east of the existing bridge spanning the Black River. Two lanes would be dedicated for entering State Park visitors while golf course traffic and exiting State Park visitors would utilize the roundabout. Kohler would fund the entire cost of the enhancements.

4.3.3 Socio-economic

Recreation and Tourism

The proposed golf course presents an opportunity to generate significant economic impact and help elevate the State of Wisconsin and Sheboygan County's reputation as the premier golf destination in the United States. The project is expected to create a premier new recreation facility in the Town of Wilson and Sheboygan County.

Sheboygan County is recognized as a premier golf destination to tourists from within the county as well as travelers from out of state. An approximate 23,000 additional rounds of golf are anticipated to be played at the new course, representing an increase of almost 25 percent compared to the existing environment. This positive increase will result in additional tourists that come into the Town of Wilson and Sheboygan County, which will in turn increase the number of users of the recreational amenities offered in the area. An increase in visitors will in turn also generate expenditures from guests and hospitality in Sheboygan County (SB Friedman, 2015).

The Project site is privately owned and currently not available to the public. Upon completion of the Project, the Kohler owned property would be available for recreational use creating a positive public benefit. The Project will also create increased use of the State Park and opportunities for park-users to utilize the golf course and restaurant.

Employment, Labor Force, and Income

SB Friedman Development Advisors (SB Friedman) was retained by Kohler to estimate the economic impact of the Project on three geographies including: the Town of Wilson; Sheboygan County; and an 11-county region consisting of Brown, Calumet, Fond du Lac, Manitowoc, Milwaukee, Outagamie, Ozaukee, Sheboygan, Washington, Waukesha and Winnebago counties.

In their study SB Friedman (2015) measures the total economic impact of the Project on the three geographies mentioned above. The results of the SB Friedman economic study are summarized throughout this section. In order to quantify the impacts, specific data was analyzed using an economic assessment tool.

Sources of direct economic impacts include temporary construction impacts over a three year period, expanding golf as an ongoing economic engine and creating significant public sector tax revenue benefits. When fully operational, the proposed golf course is projected to create 227 full-time equivalent permanent jobs and generate nearly \$21 million in annual economic activity for Sheboygan County households and businesses. Quantitative impacts are given in 2014 dollars.

Temporary Construction Impacts

Total development costs of the Project are estimated at \$25 million including hard and soft costs. Construction is expected to provide an immediate economic benefit for the three geographic regions analyzed as shown in Table 4-5 below. During the 3-year design and construction period, construction spending is expected to create an average of 67 direct full-time equivalent (FTE) jobs in the Town of Wilson. This equates to an annual increase of \$3.9 million in salaries and benefits, and an overall impact of \$9 million using economic multipliers.

In Sheboygan County, direct FTE positions are estimated at 95 FTE jobs. And the total labor income is estimated at \$5.3 million, with an overall impact of approximately \$12.5 million based on economic multipliers. Considering the 11-county region total FTE jobs are estimated at 102, labor income at \$5.8 million, and total impact of \$13.6 million based on economic multipliers.

Table 4-5. Total Estimated Annual Economic Impact for Construction

| | JOBS (FTE) | SALARIES AND BENEFITS | IMPACT |
|------------------|------------|-----------------------|---------|
| Town of Wilson | 67 | \$3.9M | \$9.0M |
| Sheboygan County | 95 | \$5.3M | \$12.5M |
| 11-County Region | 102 | \$5.8M | \$13.6M |

An Economic Growth Engine for Sheboygan County

Between April and October the proposed course is expected to add 23,000 rounds of golf to the region, increasing the level of economic impact in Sheboygan County (SB Friedman, 2015). When fully operational, Kohler anticipates employing 168 people in full and part-time jobs with approximately \$3.6 Million in annual associated salaries and benefits. 88 percent of the positions are expected to be filled by residents of Sheboygan County. Expenditures from guests and hospitality are also expected to increase due to the proposed course, generating an additional \$6.5M in lodging and purchases of food, beverage, and retail goods.

Increased Tax Revenue

Using existing data from the Wisconsin Department of Revenue (WDR) and data from Kohler on comparable golf course in the country, SB Friedman evaluated the impact of the Project on tax revenue. Including property, sales, income, motor vehicle fuel, and hotel room taxes it is anticipated that the new golf course will generate \$1,116,000 in tax revenue (based on 2013 tax rates).

4.3.4 Historical and Archaeological

The Project was designed to avoid the known burial mounds in the northwest corner of the Kohler Property. No additional human remains or burial mounds were discovered during the 2014 survey. Additional studies are scheduled to resume in spring of 2015, weather permitting. Upon completion, the results of these studies will be sent to the SHPO for evaluation. In accordance with State and Federal statutes, potential impacts to National Register eligible archaeological resources will be avoided, minimized, and/or mitigated.

4.3.5 Visual and Aesthetics

The lakeshore and associated dune habitats are essential to the natural and minimalistic golf course design and will not be modified. The Project will create gaps in the forest canopy and increase sight distances throughout the Property. Greater variations in the landscape (open areas contrasted with forested areas) will add scenic interest to the current forested landscape. The distinctive undulating dune topography will be retained. The Project will introduce several sustainable and aesthetically appealing structures to the Property and increase access to and on the Property via roads and cart paths.

By removing invasive species and actively preserving the natural, native flora, the aesthetic quality of the parcel will be improved. Some trees bordering the beach will be removed, allowing longer sight lines between the Project and Lake Michigan. The majority of the dunes and beach system will remain natural, allowing it to retain its distinctive scenic attractiveness and high scenic integrity. The aesthetics associated with the existing forested landscape will be modified, but enhanced by picturesque golf views.

The viewshed associated with adjacent lands will remain largely unchanged, since the Project will be screened on three sides by woody vegetation, either original to the site or planted. The enhanced views of the property would be visible from Lake Michigan.

The Project will place high value on the landscape integrity and aesthetics: landscape variation and interspersion of native vegetation, long views within the Property and to the lakeshore vista, and natural-appearing topography. Incorporating these landscape features will enhance visual and aesthetic features of the Kohler Property.

4.4 OTHER SPECIAL RESOURCES

Stopover habitat for migratory birds is an important component along the Lake Michigan shoreline. Songbirds utilize the forested habitat along the shoreline during spring and fall migration. The WDNR recognizes a 10-mile zone landward of the shoreline as potential stopover habitat.

Migratory birds that utilize Lake Michigan waters and the beach area along the Kohler Property will not be impacted by the Project, since these areas will remain undisturbed.

The Project design intends to keep 50 percent of the forested habitat on the Kohler Property intact ensuring availability during songbird migration. Following construction of the golf course, forest cover within the Kohler Property will likely provide similar stopover habitat to the adjacent residential areas and the State Park. Analysis of land cover data indicates approximately 54 percent of the State Park property consists of forested or shrub cover. The introduction of an approximately 5 acre irrigation pond will also create a valuable and beneficial stopover habitat for water birds that does not currently exist on the property.

4.5 ADVERSE IMPACTS THAT CANNOT BE AVOIDED

Modifications to the course layout and entrance road location have avoided and minimized impacts to the extent practicable. Impacts that cannot be avoided have been minimized with mitigation measures described in Section 4.6. The following summarizes unavoidable impacts from the Project:

- Impacting of approximately 4 acres of State Park property (primarily utilized for maintenance) with an easement from Beach Park Road, east of the Black River. The

preferred alternative avoids construction of a new Black River crossing and minimizes wetland, stream, and floodplain impacts.

- Conversion of less than 5 acres of wetland habitat. The preferred alternative minimizes wetland impacts from more than 25 acres to less than 5 acres.
- Conversion of the existing forested cover may affect stopover habitat for migratory birds. The preferred alternative minimizes site disturbance ensuring that approximately 50 percent of the forested habitat remains available for migratory stopover habitat.
- Archaeological surveys will resume in 2015, weather permitting. The preferred alternative will be modified in consultation with the SHPO to avoid potential sensitive areas.

4.6 MITIGATIVE MEASURES

Use of State Park LAWCON land to allow Project access will require compensation in accordance with the WDNR and NPS as determined acceptable by such authorities.

Impacts to wetlands from the Project will require wetland mitigation in accordance with the USACE and WDNR requirements. The preferred option for wetland mitigation required by the WDNR and USACE are wetland banking and the Wisconsin Wetland Conservation Trust, also referred to as the In-Lieu Fee (ILF) program. The Project is located in the Northwestern Lake Michigan Bank Service Area (BSA). The preferred option would be to purchase credits from a bank site in the same BSA such as Sheboygan County's proposed Amsterdam Dunes wetland mitigation bank, if available.

Kohler's second option is to purchase mitigation credits from the WDNR's ILF program to mitigate wetland impacts resulting from the Project (at a ratio of 1.45 acres of new wetlands for every 1 acre impacted). The ILF program works similarly to purchasing credits from a bank site; however, the purchase is made through the WDNR which is then responsible for the restoration, establishment, enhancement and/or preservation of aquatic resources.

To avoid and minimize impacts to [REDACTED] and breeding migratory bird species protected under the federal MBTA, vegetation and tree clearing will be minimized during the peak nesting season which occurs between March and October. Tree clearing activities will be scheduled, to the extent practicable, outside of this time period to minimize disturbance to active nests and avoid the direct take of [REDACTED] eggs and/or nestlings.

Dust generated during construction will be minimized by applying water to haul roads and high traffic areas.

Kohler will undertake forest management activities to minimize the impact of the Project on the ecosystem. At least 50 percent of the forest habitat will be retained, providing wildlife habitat. Kohler will manage invasive species within the forest habitat with the goal of eradication, and will restore native forest vegetation where appropriate. Kohler will integrate rare species protection into the Project, including avoiding impacts to [REDACTED], relocating or re-establishing populations of State listed plants, and protecting high quality habitats with educational and "Do Not Disturb" signs and markers.

Kohler will implement storm water BMPs during construction and operation of the Project. Runoff will be treated and allowed to infiltrate into the groundwater.

As part of the Project, Kohler will provide an access easement to the lakeshore for homeowners in the Timberlake Subdivision.

Kohler will develop a program with the Town of Wilson to mitigate potential impacts to adjacent private water supply wells. This program has been successfully implemented at Whistling Straits.

5.0 EVALUATION OF PROJECT SIGNIFICANCE

5.1 ENVIRONMENTAL EFFECTS AND THEIR SIGNIFICANCE

5.1.1 Long- and Short-Term Primary and Secondary Effects

Long Term Primary

Positive Effect

- Increased economic activity for the Town of Wilson, City of Sheboygan, Sheboygan County and the State of Wisconsin
- Preserved distinctive scenic quality
- Invasive species management on Kohler Property
- Preservation of the beach and water for migrating aquatic/shore birds
- Enhancement of area property values
- Increased tax revenue
- Increased employment
- Wildlife habitat creation (irrigation pond)
- Protection of rare species [REDACTED]
- Opening private property to general public
- Timberlake Subdivision lake access
- Increased scenic interest and views
- Increased exposure to State Park
- Enhancements to the existing State Park entrance
- Wetland habitat replaced in watershed

Negative Effect

- Decreased wooded habitat
- Decreased wetland function (wildlife habitat, floristic integrity, and groundwater)
- Slight traffic increase

Short term Primary

Positive Effect

- Economic benefits from construction employment
- Economic benefits from local business purchases

Negative Effect

- Construction traffic
- Air emissions during construction
- Temporary wildlife displacement

Long and Short Term Secondary

Positive Effect

- Significant employment
- Employee retention in the community

Negative Effect

- Decreased floral diversity
- Wetland type conversion (woody to herbaceous)
- Fragmentation of wildlife movement corridor and modified migratory stopover habitat

5.1.2 Environmental Effects on Geographically Scarce Resources

Geographically scarce resources associated with the Project include the lakeshore and beach habitat located on the east portion of the Kohler Property. Impacts to these habitats will be avoided and minimized. Similar habitats also exist south of the Project on State Park property.

Additional geographically scarce resources on the Property include the Wisconsin NHI communities including [REDACTED]. These habitats also exist south of the Project on State Park property. Although impacts are small, the Project may impact these [REDACTED]. The acreage of wetland impacts will be estimated during the golf course design and permitting phase. The wetland impacts have been reduced significantly to less than 5 acres and will be mitigated through programs administered by WDNR and USACE. Opportunities to further minimize wetland impacts will continue to be evaluated.

The Project is designed to protect regulated rare plant [REDACTED] present along the lakeshore. These habitats also exist south of the Project on State Park property.

The Project schedule will be implemented to minimize impacts to breeding bird and migratory stopover habitat. Tree clearing will be minimized during the peak migratory and nesting seasons.

5.1.3 Irreversible Impacts

Irreversible impacts include Project effects that would take a long period (over 50 years) to replace or result in removal of a feature known only to exist on the Kohler Property. Field studies do not indicate any natural or cultural resources unique to the Kohler Property.

Removal of 50 percent of the existing wooded habitat is considered irreversible. Construction of the irrigation pond is also considered irreversible, however, this pond will provide a large inland open water habitat currently lacking in the local area.

5.2 SIGNIFICANCE OF CUMULATIVE EFFECTS

Cumulative impacts are those that result when the effects of an action are added to or interact with other effects in a particular place and within a particular time. The creation of a world-class golf course will add to the existing golf course in Sheboygan County and reinforce the area as a golf destination, resulting in further development of golf-related services. This will have significant economic benefits for the area. Development pressure within the immediate vicinity of the Property will be low, given that the surrounding State Park is protected land. This will allow for continued protection of habitat and endangered resources in the area, reducing the cumulative effects to regional populations of flora and fauna.

Opening the Property for public recreation and Timberlake residents' lake access will increase the recreational use value of the area, building on the popularity of the adjacent State Park.

There is not expected to be any cumulative impacts from irrigation to the water supply or water quality.

Development of the high-visibility, environmentally sensitive, world-class golf course may result in the Project serving as a model for future golf courses.

Ecological cumulative effects from this Project include partial conversion of undisturbed habitat. Kohler intends to continue to work cooperatively with Federal and State agencies to reduce the cumulative effects of the Project.

5.3 SIGNIFICANCE OF RISK

The Project is located along the Lake Michigan shoreline and adjacent to the State Park property. Avoidance and minimization measures have been considered to minimize impacts. Implementation of mitigative measures will minimize the risk associated with this Project. Adjoining lands provide similar habitats to those found on the Kohler Property therefore the risk to the local ecosystem is minimized.

5.4 SIGNIFICANCE OF CONTROVERSY OVER ENVIRONMENTAL EFFECTS

The public has been informed of the Project since its introduction on April 7, 2014 at the Town of Wilson Board meeting, and the Project has been discussed in local newspapers and other local forums since then. Table 5-1 contains information on public involvement for the Project. At the conclusion of the July 16, 2014 plan commission meeting, the Town of Wilson Plan Commission requested that State and Federal permits for the Project be pursued before consideration of the conditional use permit application resumes. Additional public meetings with the Town of Wilson will occur after Federal and State permitting has progressed.

Table 5-1. Public Meetings for the Project

| DATE | AGENCY | TOPIC | COMMENTS |
|---------------|-----------------------------------------------------------|---------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| April 7, 2014 | Town of Wilson Town Board | Project Introduction | Initial presentation during a public meeting to the Town of Wilson Town Board |
| May 12, 2014 | Town of Wilson Plan Commission | Conditional use permit public hearing | Presentation to the Town of Wilson Plan Commission as part of the conditional use permit application process |
| July 1, 2014 | Black River First Responders, Black River Fire Department | Emergency services | Meeting to review project and develop recommendations to improve emergency response |
| July 16, 2014 | Town of Wilson Plan Commission | Public Input on project on conditional use permit application | Meeting to gather public input on project. Plan Commission requested Kohler to obtain Federal and State permits before continuing Plan Commission process |

5.5 AGENCY CONSULTATION

Table 5-2 contains information on consultations conducted with State and Federal agencies regarding various topics on the permitting process and requirements. Consultations will continue as needed to complete the permitting process.

Table 5-2. Agency Consultation for the Project

| DATE | AGENCY | TOPIC | COMMENTS |
|--------------------|------------|----------------------|---------------------------------------------------------------------------------|
| July 31, 2014 | WDNR | Site Visit | Site visit with WDNR officials to view property |
| August 6, 2014 | WDNR | Permitting process | Meeting with WDNR to discuss required permits and timelines |
| August 26, 2014 | WDNR | † Resources | Request submitted for review of endangered resources |
| September 18, 2014 | USACE | Permitting process | Meeting with USACE to discuss required permits and timelines |
| September 29, 2014 | WDNR/USACE | Entrance options | Meeting with WDNR & USACE to review and discuss entrance options |
| October 1, 2014 | WDNR | Monitoring wells | Onsite visit by WDNR to view installation of monitoring wells. |
| October 3, 2014 | USFWS | Endangered Resources | Request submitted for review of endangered resources |
| October 8, 2014 | WDNR | Wetland Concurrence | Onsite meeting with WDNR to obtain concurrence on wetland delineation |
| October 17, 2014 | WDNR/USACE | Wetland Concurrence | Onsite meeting with WDNR and USACE to obtain concurrence on wetland delineation |

INTRODUCTION

Stantec Consulting Services Inc. (Stantec) performed an assured wetland determination and delineation of the Kohler Company Proposed Golf Course (the "Project Area") on behalf of Kohler Company (Kohler). The Project Area consists of two parcels including one 247-acre parcel adjacent to Lake Michigan which is owned by Kohler and one 135-acre parcel owned by the State of Wisconsin (State), located adjacent to the west limits of the Kohler parcel. The State of Wisconsin parcel is being evaluated for possible entrance road and maintenance facility alternative locations. More specifically, the Project Area is located in Sections 11 and 14, Township 14 North, Range 23 East, Town of Wilson, Sheboygan County, Wisconsin (Figure 1).

Prior to conducting the assured wetland determination and delineation, past wetland delineations conducted during the 2014 growing season by Excel Engineering, Inc. (Excel) in May 2014, (Excel, 2014) and delineations completed by Stantec staff in August 2014 were reviewed and considered during the assured wetland delineation. However, all wetland delineation work completed by Mr. Kraemer was done independent of previous wetland delineations, including completion of wetland/upland sample points. This report summarizes the results of the assured wetland delineation completed by Mr. Kraemer, a WDNR approved Assured Wetland Delineator.

The purpose and objective of the assured wetland determination and delineation was to identify the extent and spatial arrangement of wetlands within the Project Area. The wetland delineation was conducted over eight days (Sept, 19, 22, 29-30 and Oct. 13-14, 22- 23, 2014) by Jeff Kraemer, with assistance from Chuck Herrmann, Mark Remington and Everett Grosskopf. Eighty one wetland areas were identified within the Project Area. Wetland types and functional values within the Project Area were evaluated using WDNR Wetland Rapid Assessment Methodology (WRAM) version 2.0.

Wetlands and waterways that are considered waters of the U.S. are subject to regulation under Section 404 of the Clean Water Act (CWA) and the jurisdictional regulatory authority lies with the U.S. Army Corps of Engineers (USACE). Additionally, the Wisconsin Department of Natural Resources (WDNR) has regulatory authority over wetlands, navigable waters, and adjacent lands under Chapters 30 and 281 Wisconsin State Statutes, and Wisconsin Administrative Codes NR 103, 299, 350 and 353. Stantec recommends this report be submitted to local authorities, the WDNR and USACE for final jurisdictional review and concurrence.

1.0 METHODS

1.1 WETLANDS

Wetland determinations were based on the criteria and methods outlined in the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Northcentral and Northeast Region (2011), United States Corps of Engineers Wetlands Delineation Manual, Technical Report Y-87-1 (1987), and subsequent guidance documents (USACE 1991, 1992), Guidelines for Submitting Wetland Delineations in Wisconsin to the St. Paul District Corps of Engineers (USACE 1996), and the Basic Guide to Wisconsin's Wetlands and their Boundaries (Wisconsin Department of Administration Coastal Management Program 1995). Wetlands were grouped into categories based on the community classification of Eggers & Reed, version 3.1 (2014).

The wetland determination involved the use of available resources to assist in the assessment such as U.S. Geological Survey (USGS) topographic maps, U.S. Department of Agriculture Natural Resources Conservation Service (NRCS) soil survey, WDNR Wisconsin Wetland Inventory (WWI) mapping, aerial photography and previous 2014 wetland delineation data completed by Excel and Stantec.

On-site wetland determinations were made using the three criteria (vegetation, soil, and hydrology) and technical approach defined in the USACE 1987 Manual and applicable Regional Supplement. According to procedures described in the 1987 Manual and applicable Regional Supplement, areas that under normal circumstances reflect a predominance of hydrophytic vegetation, hydric soils, and wetland hydrology (e.g., inundated or saturated soils) are considered wetlands.

Additionally, as climate plays an important role in the formation and identification of wetlands, the antecedent precipitation in the months leading up to the field investigations was reviewed. The current year's precipitation data was compared to long-term (30-year) precipitation averages and standard deviation to determine if precipitation was normal, wet, or dry for the area using a WETS analysis as developed by the NRCS.

The uppermost wetland boundary and sampling points were flagged and surveyed with a Global Positioning System (GPS) capable of sub-meter accuracy and mapped using Geographical Information System (GIS) software.

1.2 WETLAND FUNCTIONAL ASSESSMENT

Wetland types and functional values within the Project Area were evaluated using WDNR Wetland Rapid Assessment Methodology (WRAM) version 2.0. Qualified botanists collected vegetation community data to support completion of the wetland functional assessment during site visits on September 22, 24 and October 2, 2014. In order to evaluate functional values among wetland types, wetlands were grouped into categories based on the community classification of Eggers & Reed, version 3.1 (2014), and WDNR-NHI Wetland Communities of Wisconsin (2014), taking into account species diversity and/or modification due to current or past land uses.

2.0 RESULTS

2.1 SITE DESCRIPTION

The Project Area consists of a mix of upland and a variety of wetland habitats including, alder thicket, beach, dunes, interdunal, ridge and swale, floodplain forest, wet meadow, mosaic beech/maple wetland/upland complex, old field, upland forest, and pine plantations. The Black River is located in the central portion of the Project Area in a north-south orientation and delineates the parcel boundary between the Kohler and State-owned parcel. The Kohler parcel consists of nearly level to undulating terrain characterized by the Lake Michigan beach, dunes, and alternating ridges and swales oriented parallel to the Lake Michigan shoreline. With the exception of the open beach and dune areas located adjacent to the lake, most of the Kohler parcel is forested, with smaller areas of shrub and herbaceous vegetation located in the west portion of the parcel within the Black River floodplain. The State parcel, which is part of Kohler-Andrae State Park, consists of nearly level to gently rolling terrain generally sloping from a topographic high on the west to the Black River on the east. Two intermittent streams flowing from northwest to southeast cross the State Property, and discharge into the Black River. The State parcel is comprised of forested, shrub, and herbaceous vegetation.

Soils mapped within the Project Area by the NRCS Soil Survey of Sheboygan County are listed below in Table 2.1.1 and are shown on Figure 2. The hydric soil status along with drainage classification of each soil unit, as indicated by the NRCS List of Hydric Soils for Sheboygan County, is also included in the table. Wetlands identified during the field investigation are located primarily within areas mapped as hydric soils, with the exception of most wetlands located within the depressions associated with the interdunal and ridge and swale complex.

TABLE 2.1.1: Soil Survey Map Units within Project Area

| Sheboygan County, Wisconsin Soil Survey Name and Map Unit | Drainage Classification | Hydric Rating |
|-----------------------------------------------------------------------|-------------------------|----------------------|
| Adrian muck (Ag) | Very poorly drained | Predominantly Hydric |
| Alluvial land, wet (An) | Poorly drained | Predominantly Hydric |
| Beaches, sandy (Bd) | Moderately well drained | Non- Hydric |
| Dune land (Dn) | Excessively drained | Non- Hydric |
| Granby loamy fine sand (Gb) | Very poorly drained | Predominantly Hydric |
| Hebron sandy loam, sandy subsoil variant, 2 to 6 percent slopes (HfB) | Moderately well drained | Non- Hydric |
| Houghton muck (Hu) | Very poorly drained | Predominantly Hydric |
| Oakville loamy fine sand, 0 to 6 percent slopes (OaB) | Moderately well drained | Non- Hydric |
| Oakville loamy fine sand, 6 to 12 percent slopes (OaC) | Well drained | Non- Hydric |
| Palms muck (Pa) | Very poorly drained | Predominantly Hydric |
| Sisson very fine sandy loam, 2 to 6 percent slopes (SrB) | Well drained | Non- Hydric |

The Wisconsin Wetland Inventory (WWI) map identifies two wetland areas within the Project Area (Figure 3). One T3/E2K (broad-leaved deciduous/emergent palustrine) wetland is located on the northeast portion of the property and one T3/E1K (broad-leaved deciduous/emergent palustrine) wetland associated with the Black River floodplain and tributary streams located within the central portion of the site (Figure 3). The field delineated wetlands on the State parcel and along the Black River are located within the same vicinity as wetlands identified on the WWI map. In addition to the wetlands identified on the WWI map for the Kohler parcel, numerous small depressional wetlands were delineated.

Precipitation data was obtained from the Sheboygan weather station and used for the WETS analysis (Appendix B). Based on the WETS analysis, conditions were drier than normal to normal.

2.2 WETLANDS

Eighty one wetlands were identified and delineated within the Project Area. Wetland determination data forms were completed for 238 sample points along transects through the wetlands and adjacent lands and contained in Appendix C. Representative photographs of the wetlands and adjacent uplands are contained in Appendix D along with a CD of photos from each sample point. The wetland boundary and sample point locations are shown on Figure 4.

The wetland boundary was determined based on distinct differences in vegetation, hydrology, soils and topography consisting of the following: 1) Transition from, alder thicket, hardwood swamp, seasonally flooded basin, or wet meadow wetland communities dominated by hydrophytic vegetation to upland communities including dune, fallow old field, or woodlands (dune or Northern dry, dry-mesic, mesic); 2) Transition from saturated soils within the wetland to lack of wetland hydrology indicators within the adjacent upland; and 3) Transition from poorly drained hydric soils to non-hydric soils. Please note that numerous seasonally flooded basins on the Kohler Property did not contain primary indicators of wetland hydrology during the fall 2014 delineation; however, data collected during spring 2014 field delineations indicate that wetland hydrology was observed. In these cases, wetlands were identified as containing naturally problematic hydrology due to seasonal limitations of observing saturated or inundated soils. The transition from wetland to upland characteristics generally correlated with a well-defined topographic break.

Wetland characteristics are summarized in Appendix E (Table 1) and communities are described in detail in the following sections. Please note that multiple wetlands within the Project Area contain more than one wetland community.

2.2.1 Alder Thicket

Alder Thicket wetland communities are present in extensive areas within the Black River floodplain and tributary streams (Wetland BR) and are also present in portions of the contiguous linear wetland (Wetland NE) located within the Kohler parcel. This community is characterized by the dominant shrub species, speckled alder (*Alnus incana*), and a perennially saturated substrate. Occasional green ash (*Fraxinus pennsylvanica*) and box elder (*Acer negundo*) occur within the alder thicket. Common ground layer species include blue-joint grass (*Calamagrostis canadensis*), common lake sedge (*Carex lacustris*), fowl manna grass (*Glyceria striata*), and reed canary grass (*Phalaris arundinacea*).

2.2.2 Hardwood Swamp

Hardwood Swamp wetland communities occur within the floodplain of the Black River, along tributary streams, and in depressions within the State parcel and Kohler parcel. The community is characterized by a relatively open tree canopy with 50 to 75% cover, dominated by green ash and sugar maple (*Acer saccharum*). The understory varies from brushy to relatively open. Speckled alder and Japanese barberry (*Berberis thunbergii*) are dominant in the shrub layer. Common herbaceous species include common tussock sedge (*Carex stricta*), blue-joint grass, white avens (*Geum candense*), giant goldenrod (*Solidago gigantea*), blue iris (*Iris virginica*), skunk cabbage (*Symplocarpus foetidus*) and sensitive fern (*Onoclea sensibilis*). In addition, small shrub-carr components commonly are located within this community, primarily dominated by red osier dogwood (*Cornus alba*).

2.2.3 Mosaic Beech/Maple Complex

A mosaic of upland and wetland Beech/Maple woodland occurs within the northeast portion of Black River floodplain (Wetland BR) from the north property line extending south to sample point BR-8AW. The community is approximately 3.88 acres and is characterized by a moderately closed tree canopy with 50-75% cover, dominated by American beech (*Fagus grandifolia*), and sugar maple. Sample points BR-9AU and BR-10BU represent typical upland cradle-knolls conditions present within this community. The wetland boundary within this community was identified to incorporate all wetland components of the mosaic area, which includes many upland knolls that were too small and numerous to identify individually. Using best professional judgment, this community was estimated to be comprised of approximately 90 percent wetland, although extensive sampling was not conducted within the area to quantify wetland/upland percentages.

2.2.4 Seasonally Flooded Basin

Seasonally Flooded Basin wetland communities include two complexes of wetland types; Great Lakes Ridge and Swale complex along with linear interdunal swale landforms located parallel to the lakeshore that alternate with stabilized dune ridges. 56 ridge and swale wetlands occur within the Northern Dry-Mesic and Mesic Forest communities of the Kohler parcel. Approximately 4 linear interdunal wetlands occur within a matrix of forested dune and dune communities near the Lake shore on the Kohler parcel. The majority of these wetlands consist of small depressions comprised predominantly of wet meadow vegetation, with occasional components of alder thicket, forested wetland, and vernal pools represented. Tree canopy coverage within these wetlands is minimal, though occasional trees are present within the wetlands. Hydrology varies from dry to seasonal saturation. Generally, the wetlands are widely-spaced farther to the west. Dominant vegetation includes blue-joint grass, northern water-horehound (*Lycopus uniflorus*), tussock sedge, fowl manna grass, stinging nettle (*Urtica dioica*), and Baltic rush (*Juncus arcticus*) in the herbaceous layer; speckled alder, Japanese barberry, and red raspberry (*Rubus idaeus* var. *strigosus*) in the shrub layer; and green ash in the tree layer.

2.2.5 Wet Meadow

The wet meadow communities primarily exist within the Black River floodplain, primarily along the river banks. This community is also present in Wetland NE located within the Kohler Property. Dominant vegetation includes blue-joint grass, reed canary grass, giant goldenrod, Canada goldenrod (*Solidago canadensis*), common lake sedge, common tussock sedge, and Canadian wood-nettle (*Laportea canadensis*). Scattered within portions of the wet meadow community are speckled alder in the shrub stratum along with green ash and boxelder in the tree stratum.

2.3 UPLAND

Uplands within the Project Area consist of dune, beach, forest dune, Northern forest (dry, dry-mesic, mesic), fallow old field and pine plantation. Common species include sand-reed grass (*Calamovilfa longifolia* var. *magna*), common juniper (*Juniperus communis*) creeping junipers (*Juniperus horizontalis*), sugar maple, American beech, red oak (*Quercus rubra*), black cherry (*Prunus serotina*), green ash, quaking aspen (*Populus tremuloides*), paper birch (*Betula papyrifera*), Japanese barberry, multiflora rose (*Rosa multiflora*), Pennsylvania sedge (*Carex pensylvanica*), wood fern (*Dryopteris carthusiana*), smooth brome (*Bromus inermis*), timothy (*Phleum pratense*), quackgrass (*Elymus repens*), Canada goldenrod and common milkweed (*Asclepias syriaca*). The uplands lack field indicators of hydric soil, and are not located in landscape positions that typically support wetland communities. Consequently these areas were not delineated as wetland.

2.4 FLORISTIC QUALITY ASSESSMENT

Wetland functional quality assessments were completed, for a total of nine wetland types, consisting of six distinct natural communities and three additional degraded components of those communities. WRAM forms and associated species lists are included in Appendix F. A map depicting the Assessment Area and the 100-m Buffer is included in Figure 5.

Wetland functional values identified for the wetlands within the Project Area include human use values, floristic integrity, wildlife habitat, shoreline protection, flood and stormwater storage, water quality protection, and groundwater processes. Of these, the most significant wetland functional values within the Project Area were wildlife habitat, floristic integrity, and groundwater processes.

2.5 OTHER ENVIRONMENTAL CONSIDERATIONS

This report is limited to the identification of state and/or federally regulated wetlands within the Project Area. Kohler Company is completing other site specific-studies applicable to Federal, state, or local authority.

2.6 AGENCY FIELD REVIEW

Stantec and Kohler staff met with WDNR and USACE staff on the Project Area on October 8 and October 17, 2014 to review the Project Area, wetland delineation approach and findings. WDNR and USACE staff was in agreement with the assured wetland delineation approach and preliminary results presented by Stantec during the October 8 and 17, 2014 meeting. Table 2.6.1 summarizes attendees for each meeting.

3.0 CONCLUSION

Stantec performed an assured wetland determination and delineation of the Project Area on behalf of Kohler Company. The Project Area includes parcels owned by Kohler Company and the State of Wisconsin, totaling 382 acres located in Sections 11 and 14, Township 14 North, Range 23 East, Town of Wilson, Sheboygan County, Wisconsin. The purpose and objective of the assured wetland determination and delineation was to identify the extent and spatial arrangement of wetlands within the Project Area.

Eighty one (81) wetlands were identified and delineated on the State and Kohler parcels in accordance with state and federal guidelines and were subsequently flagged, surveyed with GPS, and mapped using GIS software. There were 44.91 acres of wetlands identified on the Kohler parcel and 79.21 acres of wetlands identified on the State parcel. Wetlands are composed of alder thicket, hardwood swamp, seasonally flooded basins, and wet meadow. Adjacent uplands are composed of dune, Great Lakes beach, forest dune, Northern forest (dry, dry-mesic, mesic), fallow old field and pine plantation.

The USACE has regulatory authority over Waters of the U.S. including adjacent wetlands, and the WDNR has regulatory authority over wetlands, navigable waters, and adjacent lands under Chapters 30 and 281 Wisconsin State Statutes, and Wisconsin Administrative Codes NR 103, 299, 350 and 353.

Prior to beginning work at this site or disturbing or altering wetlands, waterways, or adjacent lands in any way, Stantec recommends that the owner obtain the necessary permits or other agency regulatory review and concurrence with regard to the proposed work to comply with applicable regulations.

The information provided by Stantec regarding wetland boundaries is a scientific-based analysis of the wetland and upland conditions present on the site at the time of the fieldwork. The delineation was performed by experienced and qualified professionals using standard practices and sound professional judgment. The ultimate decision on wetland boundaries rests with the USACE and, in some cases, the WDNR or a local unit of government. As a result, there may be adjustments to boundaries based upon review by a regulatory agency. An agency determination can vary from time to time depending on various factors including, but not limited to recent precipitation patterns and the season of the year. In addition, the physical characteristics of the site can change over time, depending on the weather, vegetation patterns, drainage activities on adjacent parcels, or other events. Any of these factors can change the nature and extent of wetlands within the Project Area.

Appendix B – WETS Analysis

WETS Analysis Worksheet

Project Name: Kohler Golf Course

Project Number: 193703078

Period of interest: July-September 19th

Station: Sheboygan 7725

County: Sheboygan County

Long-term rainfall records (from WETS table)

| | Month | 3 years in 10 less than | Normal | 3 years in 10 greater than |
|------------------|-----------|----------------------------|--------------|-------------------------------|
| 1st month prior: | Sept 1-19 | 1.73 (1.06) | 3.29 | 4.01 (2.48) |
| 2nd month prior: | August | 2.58 | 4.08 | 4.92 |
| 3rd month prior: | July | 2.3 | 3.19 | 3.76 |
| | | Sum = | 10.56 | |

Site determination

| Site Rainfall (in) | Condition Dry/Normal*/Wet | Condition** Value | Month Weight | Product |
|-----------------------|------------------------------|----------------------|-----------------|-----------|
| 1.29 | Normal | 2 | 3 | 6 |
| 2.72 | Normal | 2 | 2 | 4 |
| 1.64 | Dry | 1 | 1 | 1 |
| | | Sum = | Sum*** = | 11 |

*Normal precipitation with 30% to 70% probability of occurrence

Determination: _____ Wet

**Condition value:

Dry = 1

Normal = 2

Wet = 3

***If sum is:

6 to 9 then period has been drier than normal

10 to 14 then period has been normal

15 to 18 then period has been wetter than normal

_____ Dry

 X Normal

Precipitation data source: <http://agacis.rcc-acis.org/55117/wets/results>

Appendix C – Wetland Determination Data Forms

| | | | |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|----------------------------------------------|----------------------------------------|
| Project/Site: Kohler Golf Course | | Stantec Project #: 193703195 | Date: 08/13/14 |
| Applicant: Excel Engineering | | Investigator #1: Chuck Herrmann | Investigator #2: Mark Remington |
| Soil Unit: Granby loamy fine sand | | NWI/WWI Classification: T3K | County: Sheboygan |
| Landform: Terrace | | Local Relief: Linear | State: Wisconsin |
| Slope (%): 0-2 | | Latitude: N/A | Longitude: N/A |
| | | Datum: N/A | Wetland ID: W1 |
| Are climatic/hydrologic conditions on the site typical for this time of year? (if no, explain in remarks) <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | | Section: 14 | Sample Point: 8u |
| Are Vegetation <input type="checkbox"/> , Soil <input type="checkbox"/> , or Hydrology <input type="checkbox"/> significantly disturbed? | | Community ID: upland deciduous forest | Township: 14N |
| Are Vegetation <input type="checkbox"/> , Soil <input type="checkbox"/> , or Hydrology <input type="checkbox"/> naturally problematic? | | Range: 23 | Dir: E |
| Are normal circumstances present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | | | |

SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Hydric Soils Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No |
| Wetland Hydrology Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: **Sample plot is located in an upland deciduous forest. WETS analysis determined that the antecedent precipitation conditions were drier than normal.**

| Prevalence Index = B/A = | | <u>4.084</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

- Tree** - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.
- Sapling/Shrub** - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.
- Herb** - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.
- Woody Vines** - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Additional Remarks:

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No Is This Sampling Point Within A Wetland? Yes No

Remarks: **Sample plot is located in a mesic forest. Recent rain even of 1.65 inches in last 24 hours. WETS analysis determined that the antecedent precipitation conditions were normal. 2.78 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.**

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Hydic Soils Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |
| Wetland Hydrology Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: **the sample plot is located in a hardwood swamp. Recent rain even of 1.65 inches in last 24 hours. WETS analysis determined that the antecedent precipitation conditions were normal. 2.78 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation. Seasonal flow 6 feet to south of point, with 10" of water depth and 5 feet wide.**

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Additional Remarks:

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No **Is This Sampling Point Within A Wetland?** Yes No

Remarks: **The sample plot is located in a wet meadow. Recent rain even of 1.65 inches in last 24 hours. WETS analysis determined that the antecedent precipitation conditions were normal. 2.78 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.**

| UPL spp. | <u>60</u> | x 5 = | <u>300</u> |
| Total | <u>275</u> (A) | | <u>1045</u> (B) |
| Prevalence Index = B/A = | | | <u>3.800</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Additional Remarks:

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available: **N/A**

Remarks: **The presence of 3 secondary indicators at the sample plot provides evidence of wetland hydrology. Hydrology identified as naturally problematic due to seasonal occurrence of saturation/inundation.**

SOILS

Map Unit Name: **Granby loamy fine sand** Series Drainage Class: **very poorly to poorly**

Taxonomy (Subgroup): **Typic Endoaquolls**

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Additional Remarks:

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No **Is This Sampling Point Within A Wetland? Yes No**

Remarks: Sample plot is located in a hardwood swamp. The hydrology of this sample plot is naturally problematic due to lack of primary hydrology indicators during the normal dry season. WETS analysis determined that the antecedent precipitation conditions were normal. 1.13 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.

Additional Remarks:

SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Hydic Soils Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |
| Wetland Hydrology Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: **Sample plot is located in a hardwood swamp. WETS analysis determined that the antecedent precipitation conditions were normal. 1.13 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation. Wetland hydrology is seasonally and denoted as naturally problematic given the time of year of the delineation.**

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No Is This Sampling Point Within A Wetland? Yes No

Remarks: **Sample plot is located in on a toe slope of an upland fallow field swale. Recent rain even of 1.65 inches in last 24 hours. WETS analysis determined that the antecedent precipitation conditions were normal. 2.78 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.**

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC: 1 (A)

Total Number of Dominant Species Across All Strata: 1 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100.0% (A/B)

Prevalence Index Worksheet

| Total % Cover of: | Multiply by: | |
|-----------------------------|--------------|----------------|
| OBL spp. <u>0</u> | x 1 = | <u>0</u> |
| FACW spp. <u>100</u> | x 2 = | <u>200</u> |
| FAC spp. <u>0</u> | x 3 = | <u>0</u> |
| FACU spp. <u>0</u> | x 4 = | <u>0</u> |
| UPL spp. <u>0</u> | x 5 = | <u>0</u> |
| Total <u>100</u> (A) | | <u>200</u> (B) |
| Prevalence Index = B/A = | | <u>2.000</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC: 1 (A)
 Total Number of Dominant Species Across All Strata: 2 (B)
 Percent of Dominant Species That Are OBL, FACW, or FAC: 50.0% (A/B)

Prevalence Index Worksheet

| | | | |
|--------------------------|-----------|----------------|----------------|
| Total % Cover of: | | Multiply by: | |
| OBL spp. | <u>0</u> | x 1 = | <u>0</u> |
| FACW spp. | <u>0</u> | x 2 = | <u>0</u> |
| FAC spp. | <u>30</u> | x 3 = | <u>90</u> |
| FACU spp. | <u>40</u> | x 4 = | <u>160</u> |
| UPL spp. | <u>35</u> | x 5 = | <u>175</u> |
| Total | | <u>105</u> (A) | <u>425</u> (B) |
| Prevalence Index = B/A = | | <u>4.048</u> | |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

- Tree** - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.
- Sapling/Shrub** - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.
- Herb** - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.
- Woody Vines** - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.

Additional Remarks:

Vegetation appears to be mowed on a regular basis as trail maintenance.

| UPL spp. 0 | x 5 = | 0 |
| Total 153 | (A) | 285 (B) |
| Prevalence Index = B/A = | | 1.863 |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

| FACU spp. | <u>4</u> | x 4 = | <u>16</u> |
| UPL spp. | <u>0</u> | x 5 = | <u>0</u> |
| Total | | <u>98</u> (A) | <u>199</u> (B) |
| Prevalence Index = B/A = | | <u>2.031</u> | |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Additional Remarks:

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No **Is This Sampling Point Within A Wetland?** Yes No

Remarks: Sample plot is located in a hardwood swamp. The hydrology of this sample plot is naturally problematic due to lack of primary hydrology indicators during the normal dry season. WETS analysis determined that the antecedent precipitation conditions were normal. 1.13 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation. Atypical situations require the use of professional judgment. Based on landscape position, hydric soils present, hydrophytic vegetation present, and the timing of the delineation, this area appears it may be inundated or saturated for longer periods of time during the early growing season.

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available: **N/A**

Remarks: **The presence of 2 primary and 3 secondary indicators at the sample plot provides evidence of wetland hydrology. The sample plot is located approximately 2 feet lower in elevation than surrounding upland.**

SOILS

Map Unit Name: **Adrian muck** Series Drainage Class: **very poorly**

Taxonomy (Subgroup): **Terric Haplosaprists**

Profile Description (Describe to the depth needed to document the indicator or confirm the absence of indicators.) (Type: C Concentration, D Depletion, RM Reduced Matrix, CS Covered/Coated Sand Grains, Location PL Pore Lining, M Matrix)

| Top Depth | Bottom Depth | Horizon | Matrix | | | Redox Features | | | | Texture (e.g. clay, sand, loam) | |

| Prevalence Index = B/A = | | <u>2.439</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Additional Remarks:

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No Is This Sampling Point Within A Wetland? Yes No

Remarks: **Sample plot is located in on an upland ridge. Recent rain even of 1.65 inches in last 24 hours. WETS analysis determined that the antecedent precipitation conditions were normal. 2.78 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.**

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Additional Remarks:

| Total <u>143</u> (A) | | <u>228</u> (B) |
| Prevalence Index = B/A = | | <u>1.594</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No Is This Sampling Point Within A Wetland? Yes No

Remarks: **Sample plot is located in an alder thicket. The hydrology of this sample plot is naturally problematic due to lack of primary hydrology indicators during the normal dry season. WETS analysis determined that the antecedent precipitation conditions were normal. 1.13 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.**

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No **Is This Sampling Point Within A Wetland?** Yes No

Remarks: **Sample plot is located in a shrub-carr component within a hardwood swamp. The hydrology of this sample plot is naturally problematic due to lack of primary hydrology indicators during the normal dry season. WETS analysis determined that the antecedent precipitation conditions were normal. 1.13 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.**

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Additional Remarks:

SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Hydic Soils Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No |
| Wetland Hydrology Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: Sample plot is located in a mesic forest. WETS analysis determined that the antecedent precipitation conditions were normal. 1.13 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation. Although hydrophytic vegetation is present at the sample plot, the lack of hydric soils and wetland hydrology indicate the sample plot is located in an upland mesic forest.

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

- Tree** - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.
- Sapling/Shrub** - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.
- Herb** - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.
- Woody Vines** - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.

| Total <u>84</u> (A) | | <u>240</u> (B) |
| Prevalence Index = B/A = | | <u>2.857</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Additional Remarks:

SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Hydric Soils Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No |
| Wetland Hydrology Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: **The sample plot is located in an upland forest within the growing season. WETS analysis determined that the antecedent precipitation conditions were normal. 2.30 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.**

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Additional Remarks:

| Total <u>81</u> (A) | | <u>160</u> (B) |
| Prevalence Index = B/A = | | <u>1.975</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

| Prevalence Index = B/A = | | <u>4.406</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Additional Remarks:

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Hydic Soils Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |
| Wetland Hydrology Present? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: **The sample plot is located within a wet meadow within the growing season. Typical representation of wetland depression in mosaic beech/maple wetland complex, south end of mosaic wetland complex. WETS analysis determined that the antecedent precipitation conditions were normal. 2.30 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.**

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No **Is This Sampling Point Within A Wetland?** Yes No

Remarks: **The sample plot is located in an upland forest within the growing season. Small upland terrace within the mosaic wetland complex and is a typical representation of upland in mosaic beech/maple wetland complex. WETS analysis determined that the antecedent precipitation conditions were normal. 2.30 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.**

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC: 0 (A)

Total Number of Dominant Species Across All Strata: 4 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 0.0% (A/B)

Prevalence Index Worksheet

| Total % Cover of: | Multiply by: | |
|--------------------------|--------------|----------------|
| OBL spp. <u>0</u> | x 1 = | <u>0</u> |
| FACW spp. <u>0</u> | x 2 = | <u>0</u> |
| FAC spp. <u>0</u> | x 3 = | <u>0</u> |
| FACU spp. <u>110</u> | x 4 = | <u>440</u> |
| UPL spp. <u>0</u> | x 5 = | <u>0</u> |
| Total <u>110</u> (A) | | <u>440</u> (B) |
| Prevalence Index = B/A = | | <u>4.000</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Additional Remarks:

Sample point is located within an representative upland knoll within upland/wetland mosaic complex. Area is too small to delineate as separate upland community. Approximately 15% of mosaic complex comprised of upland knolls represented by this sample point.

Number of Dominant Species that are OBL, FACW, or FAC: 6 (A)
 Total Number of Dominant Species Across All Strata: 8 (B)
 Percent of Dominant Species That Are OBL, FACW, or FAC: 75.0% (A/B)

Prevalence Index Worksheet

| | | | |
|--------------------------|-----------|---------------|----------------|
| Total % Cover of: | | Multiply by: | |
| OBL spp. | <u>9</u> | x 1 = | <u>9</u> |
| FACW spp. | <u>50</u> | x 2 = | <u>100</u> |
| FAC spp. | <u>6</u> | x 3 = | <u>18</u> |
| FACU spp. | <u>12</u> | x 4 = | <u>48</u> |
| UPL spp. | <u>0</u> | x 5 = | <u>0</u> |
| Total | | <u>77</u> (A) | <u>175</u> (B) |
| Prevalence Index = B/A = | | <u>2.273</u> | |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

Additional Remarks:

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is hydrophytic.**

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No **Is This Sampling Point Within A Wetland?** Yes No

Remarks: **The sample plot is located within an upland/wetland mosaic forest within the growing season. Small upland terrace within the mosaic wetland complex and is a typical representation of upland in mosaic beech/maple wetland complex. WETS analysis determined that the antecedent precipitation conditions were normal. 2.30 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.**

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC: 0 (A)

Total Number of Dominant Species Across All Strata: 5 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 0.0% (A/B)

Prevalence Index Worksheet

| Total % Cover of: | Multiply by: | |
|-----------------------------|--------------|----------------|
| OBL spp. <u>0</u> | x 1 = | <u>0</u> |
| FACW spp. <u>0</u> | x 2 = | <u>0</u> |
| FAC spp. <u>0</u> | x 3 = | <u>0</u> |
| FACU spp. <u>102</u> | x 4 = | <u>408</u> |
| UPL spp. <u>2</u> | x 5 = | <u>10</u> |
| Total <u>104</u> (A) | | <u>418</u> (B) |
| Prevalence Index = B/A = | | <u>4.019</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Additional Remarks:

Sample point is typical representation of upland knoll within upland/wetland mosaic complex. Mosaic consists of approximately 15% upland knolls, most were too small to delineate as upland, such as this area.

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No **Is This Sampling Point Within A Wetland?** Yes No

Remarks: **The sample plot is a typical representation of a wetland depression in mosaic beech/maple upland/wetland complex. WETS analysis determined that the antecedent precipitation conditions were normal. 2.30 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation. Atypical situations require the use of professional judgment. Based upon the landscape position, wetland hydrology and hydric soil parameters observed, the sample plot is located in a wetland.**

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: Trees and shrubs located on small upland knolls that are located in mosaic wetland complex. Approximately 15% of mosaic consists of small upland knolls to small to delineate, however the dominant condition is wetland as represented by this sample point. Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic. Wetland spring ephemeral plants mostly likely dominate the seasonally flooded basin in early growing season.

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No

Wetland Hydrology Present? Yes No

Hydric Soils Present? Yes No

Is This Sampling Point Within A Wetland? Yes No

Remarks: **The sample plot is a typical representation of wetland depression in mosaic wetland/upland complex. WETS analysis determined that the antecedent precipitation conditions were normal. 2.30 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation. Atypical situations require the use of professional judgment. Based upon the landscape position, wetland hydrology and hydric soil parameters observed, the sample plot is located in a wetland.**

Woody Vine Stratum (Plot size: 10 meter radius)

| | | | | |
|---------------|---|----------|---|---|
| 1. | — | — | — | — |
| 2. | — | — | — | — |
| 3. | — | — | — | — |
| 4. | — | — | — | — |
| 5. | — | — | — | — |
| Total Cover = | | 0 | | |

Remarks: Trees and shrubs located on small upland ridges that are located in mosaic wetland/upland complex. Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic. Wetland spring ephemeral plants mostly likely dominate the seasonally flooded basin in early growing season.

Dominance Test Worksheet

Number of Dominant Species that are OBL, FACW, or FAC: 2 (A)

Total Number of Dominant Species Across All Strata: 5 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 40.0% (A/B)

Prevalence Index Worksheet

| Total % Cover of: | Multiply by: | |
|---------------------|--------------|------------|
| OBL spp. <u>15</u> | x 1 = | <u>15</u> |
| FACW spp. <u>17</u> | x 2 = | <u>34</u> |
| FAC spp. <u>7</u> | x 3 = | <u>21</u> |
| FACU spp. <u>65</u> | x 4 = | <u>260</u> |
| UPL spp. <u>0</u> | x 5 = | <u>0</u> |

Total 104 (A) 330 (B)

Prevalence Index = B/A = 3.173

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Additional Remarks:

Approximately 15% of upland/wetland mosaic consists of upland knolls to small to delineate. Dominant condition of mosaic is wetland depressions represented by this sample point.

SUMMARY OF FINDINGS

| | |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| Hydrophytic Vegetation Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Hydic Soils Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No |
| Wetland Hydrology Present? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Is This Sampling Point Within A Wetland? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No |

Remarks: **The sample plot is located in a small upland terrace within the mosaic wetland/upland complex. Typical representation of upland in mosaic wetland. WETS analysis determined that the antecedent precipitation conditions were normal. 2.30 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.**

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: **Dominant vegetation was determined through use of the 50/20 rule. Vegetation at the sample plot is not hydrophytic.**

Additional Remarks:

Upland ridge lies approximately 2 feet above wetland complex and was distinctly defined by elevation and upland vegetation. Area was determined to be significant enough in size to delineate as upland. Area identified as upland does not contain wetland depressions and is entirely upland.

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No Hydric Soils Present? Yes No

Wetland Hydrology Present? Yes No Is This Sampling Point Within A Wetland? Yes No

Remarks: **The sample plot is located in a small upland terrace within the mosaic wetland/upland complex. Typical representation of larger sized upland in mosaic wetland. WETS analysis determined that the antecedent precipitation conditions were normal. 2.30 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation.**

| Prevalence Index = B/A = | | <u>3.699</u> |

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Additional Remarks:

Upland maple and oak woodland. No depressional wetlands in this area.

SUMMARY OF FINDINGS

Hydrophytic Vegetation Present? Yes No

Wetland Hydrology Present? Yes No

Hydric Soils Present? Yes No

Is This Sampling Point Within A Wetland? Yes No

Remarks: Sample plot is located in a seasonally wetland depression within a mosaic of depressional wetland and upland cradle knolls. WETS analysis determined that the antecedent precipitation conditions were drier than normal. 0.18 inches of rainfall was recorded near the Project 2 weeks prior of the wetland delineation. The sample plot is located in a problem area because hydrophytic vegetation is not dominant; however, based upon the wetland hydrology and hydric soils observed, the sample plot is located in a seasonally wetland depression.

Hydrophytic Vegetation Indicators:

- Yes No Rapid Test for Hydrophytic Vegetation
- Yes No Dominance Test is > 50%
- Yes No Prevalence Index is ≤ 3.0 *
- Yes No Morphological Adaptations (Explain) *
- Yes No Problem Hydrophytic Vegetation (Explain) *

* Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Definitions of Vegetation Strata:

Tree - Woody plants 3 in. (7.6cm) or more in diameter at breast height (DBH), regardless of height.

Sapling/Shrub - Woody plants less than 3 in. DBH and greater than 3.28 ft. tall.

Herb - All herbaceous (non-woody) plants, regardless of size, and woody plants less than 3.28 ft. tall.

Woody Vines - All woody vines greater than 3.28 ft. in height.

Hydrophytic Vegetation Present Yes No

Remarks: Dominant vegetation was determined through use of 50/20 rule. Vegetation at the sample plot is not hydrophytic. However, it is difficult to assess vegetation directly within the wet depressions, as many of the upland trees occur on subtle knolls elevated generally 6" or more above the surface. Additionally, these depressions likely support additional hydrophytes that may only be present earlier in the growing season.

Additional Remarks:

Mosaic of depressional wetlands, about 15% of area is upland on hummocks (cradle knolls).
