

Aquatic Plant

Australian Swamp Stonecrop; New Zealand Pygmyweed

**I. Current Status and Distribution** *Crassula helmsii*

<b>a. Range</b>	<b>Global/Continental</b>	<b>Wisconsin</b>
-----------------	---------------------------	------------------

<p><b>Native Range</b> Australia, New Zealand<sup>1</sup></p>	 <p style="text-align: center;"><i>Figure 1: Global Distribution Map<sup>2</sup></i></p>	<p>Not recorded in Wisconsin</p>
---	--	----------------------------------

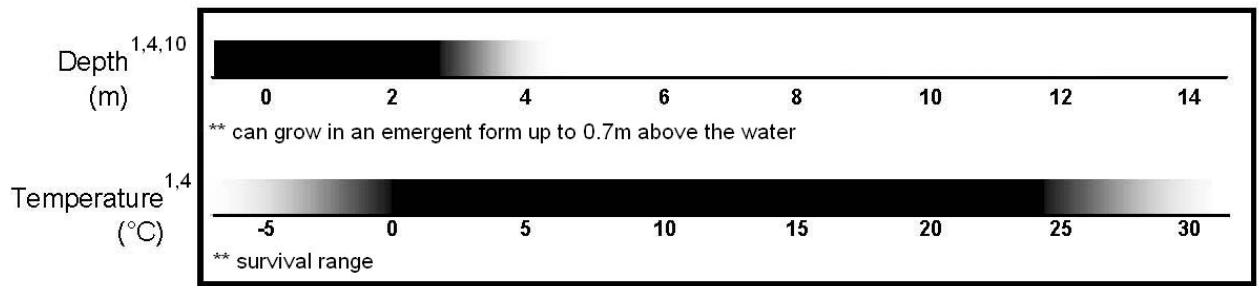

<p><b>Abundance/Range</b> Widespread: Locally Abundant: Sparse:</p>	<p>United Kingdom<sup>1</sup> Belgium, Denmark, France, Germany<sup>1</sup> Reports from Southeastern United States<sup>4</sup></p>	<p>Not applicable Not applicable Not applicable</p>
---	---	---

<p><b>Range Expansion</b> Date Introduced: Rate of Spread:</p>	<p>Essex, United Kingdom, 1950s<sup>4</sup> Rapid; number of invaded sites doubles every two years<sup>5</sup>; 1500 recorded sites, though distribution likely under-reported<sup>3,6</sup></p>	<p>Not applicable Not applicable</p>
--	--	--

<p><b>Density</b> Risk of Monoculture: Facilitated By:</p>	<p>High; occasional problem in native range<sup>7</sup> Nutrient enrichment, low energy systems<sup>5</sup></p>	<p>Unknown Unknown</p>
--	---	----------------------------

<b>b. Habitat</b>	<p>Inland and coastal wetlands, lakes, reservoirs, riverbanks, canals, ponds, slow moving rivers, low-energy systems<sup>1,5</sup></p>
-------------------	--

<b>Tolerance</b>	<p>Chart of tolerances: Increasingly dark color indicates increasingly optimal range</p>
------------------	--

<b>Preferences</b>	<p>Nutrient-enriched environments, slow-moving or static water<sup>5</sup></p>
--------------------	--

**c. Regulation**

Noxious/Regulated <sup>11</sup> :	FL, NC, WA
-----------------------------------	------------

Minnesota Regulations:	<p><i>Prohibited</i>; One may not possess, import, purchase, propagate, or transport</p>
------------------------	--

Michigan Regulations:	<p><i>Not regulated</i></p>
-----------------------	-----------------------------

Washington Regulations:	<p>State Wetland and Aquatic or Noxious Weed Quarantine List</p>
-------------------------	--

<b>II. Establishment Potential and Life History Traits</b>	
<b>a. Life History</b>	Submersed, emersed, or semi-terrestrial perennial herbaceous dicot <sup>1,4,11</sup>
<b>Fecundity</b>	High <sup>10</sup>
<b>Reproduction</b> Importance of Seeds: Vegetative:	Sexual; Asexual Low; plant flowers but produces no viable seeds (in United Kingdom) <sup>4</sup> High; one node on 5mm of stem fragment can start a new plant <sup>9</sup> ; apical turions <sup>4</sup>
<b>Hybridization</b>	Undocumented
<b>Overwintering</b> Winter Tolerance: Phenology:	High <sup>5</sup> Vigorous growth through most of the year without period of senescence (in United Kingdom) <sup>5</sup> ; flowers from July to September in Europe <sup>1</sup>
<b>b. Establishment</b>	
<b>Climate</b> Weather: Wisconsin-Adapted: Climate Change:	20-25°C in summer, 0-15°C in winter; can tolerate extended drying <sup>1</sup> ; survival temperatures ranging from -6°C to 30°C reported <sup>4</sup> Yes Undocumented
<b>Taxonomic Similarity</b> Wisconsin Natives: Other US Exotics:	Medium; family Crassulaceae (genus: <i>Penthorum</i> ) <sup>11</sup> High; <i>C. tillaea</i> & <i>C. multicava</i> introduced in western U.S. <sup>11</sup>
<b>Competition</b> Natural Predators: Natural Pathogens: Competitive Strategy: Known Interactions:	Few natural enemies are reported <sup>7</sup> Undocumented CAM photosynthesis, broad nutrient tolerance, vegetative spread, no senescence <sup>5,9,12</sup> Out-competes <i>Elodea</i> spp., <i>Ludwigia palustris</i> , and <i>Galium debile</i> in United Kingdom <sup>6</sup>
<b>Reproduction</b> Rate of Spread: Adaptive Strategies:	High Vegetative spread; turions; very small fragments are viable <sup>5,9</sup>
<b>Timeframe</b>	Doubles number of invaded sites every two years <sup>5</sup> ; currently spreading from United Kingdom to mainland Europe <sup>5</sup>
<b>c. Dispersal</b>	
Intentional: Unintentional: Propagule Pressure:	Sold as oxygenator for aquaria (often called <i>Tillaea recurva</i> or <i>T. helmsii</i> ) <sup>5,9</sup> Water currents, mud, wildlife, aquarium disposal, escape from ponds, 'contaminant' with other water plants, humans (boats, angling equipment, clothes) <sup>1,6</sup> Potentially high; fragments easily accidentally introduced <sup>10</sup>

Figure 3: Courtesy of Dan Minchin, DAISIE<sup>13</sup>

### III. Damage Potential

#### a. Ecosystem Impacts

<b>Composition</b>	Often results in almost total suppression of the native flora <sup>6,14</sup> ; six plant species in one study showed germination suppression up to 83% under <i>C. helmsii</i> <sup>15</sup> ; no significant loss of plant species numbers or changes in newt hatching <sup>15</sup> ; impoverishes the ecosystem for invertebrates and fish <sup>4</sup>
<b>Structure</b>	Monocultures can form 100% cover and smother native vegetation <sup>1,4</sup> ; fish respond to change in architecture
<b>Function</b>	Can choke ponds <sup>16</sup> ; severe oxygen depletion below dense growth <sup>9</sup>
<b>Allelopathic Effects</b>	Undocumented
<b>Keystone Species</b>	Undocumented
<b>Ecosystem Engineer</b>	Yes; dense canopy causes dissolved oxygen fluctuations, kills fish and suppresses native plants <sup>4</sup>
<b>Sustainability</b>	Dense growth threatens ecosystem sustainability
<b>Biodiversity</b>	Creates impoverished ecosystems <sup>4</sup>
<b>Biotic Effects</b>	Fish kills due to severe dissolved oxygen fluctuations <sup>9</sup>
<b>Abiotic Effects</b>	Dissolved oxygen concentration fluctuations <sup>9</sup> ; changes in water temperature; altered light regime
<b>Benefits</b>	Undocumented

#### b. Socio-Economic Effects

<b>Benefits</b>	Sold as submerged oxygenating plant for aquaria and ponds <sup>1</sup>
<b>Caveats</b>	Risk of release and population expansion outweigh benefits of use
<b>Impacts of Restriction</b>	Increase in monitoring, education, and research costs
<b>Negatives</b>	Can block ponds and drainage ditches, causing flooding <sup>1,4</sup> ; loss of aesthetic and recreational value <sup>1</sup> ; interferes with recreation and angling <sup>13</sup> ; can be mistaken for dry land with associated dangers for animals and humans <sup>1,4,13</sup>
<b>Expectations</b>	More negative impacts can be expected in eutrophic systems <sup>5</sup>
<b>Cost of Impacts</b>	Decreased recreational and aesthetic value; decline in ecological integrity; increased research expenses
<b>“Eradication” Cost</b>	Extremely expensive; eradication may be impossible

### IV. Control and Prevention

#### a. Detection

<b>Crypsis:</b>	High; confused with <i>Callitriche</i> spp. <sup>1,5</sup>
<b>Benefits of Early Response:</b>	Control is more effective at an early stage of invasion and may reduce

	turion set <sup>1,5</sup>
<b>b. Control</b>	
<b>Management Goal 1</b>	Eradication
Tool:	Must take multi-tiered approach with large scale populations <sup>14</sup>
Caveat:	May be impossible, no reported success <sup>5</sup>
Cost:	Very expensive
Efficacy, Time Frame:	Many times per year until control is achieved
<b>Management Goal 2</b>	Nuisance relief
Tool:	Mechanical control
Caveat:	Must remove entire surface layer of humic sand and vegetation <sup>6</sup>
Cost:	Expensive and labor intensive
Efficacy, Time Frame:	Produces more fragments that can increase rate of spread
Tool:	Shading with black plastic or carpet <sup>1,13</sup>
Caveat:	Only useful for very small (1-20m <sup>2</sup> ) areas <sup>1</sup>
Cost:	Affordable
Efficacy, Time Frame:	<i>C. helmsii</i> is tolerant to shade; needs to be shaded for at least 8 weeks, preferably 6 months <sup>1</sup>
Tool:	Freezing with liquid nitrogen <sup>1</sup>
Caveat:	Only useful for small areas
Cost:	Very expensive
Efficacy, Time Frame:	Partial success reported
Tool:	Chemical (glyphosate)
Caveat:	<i>C. helmsii</i> shows high uptake resistance to chemical control <sup>6,8</sup>
Cost:	Expensive
Efficacy, Time Frame:	Gives 75% reduction in height <sup>17</sup> ; elevated or multiple applications necessary at high biomass (up to 45 kg fresh wt/m <sup>2</sup> ) <sup>8</sup>
Tool:	Chemical (diquat)
Caveat:	Plants respond to chemical by budding, which may enhance spread <sup>18</sup>
Cost:	Expensive
Efficacy, Time Frame:	Most effective in the autumn and winter with water temperatures >12°C <sup>13</sup> ; more than one application may be needed <sup>13</sup> ; should use treatment in conjunction with containment by wire mesh <sup>6,17</sup>
Tool:	Biological control (grass carp)
Caveat:	<i>C. helmsii</i> is not its preferred food <sup>10</sup> ; stocking is often illegal due to occasional fertility
Cost:	Undocumented
Efficacy, Time Frame:	Fish will not survive severe dissolved oxygen fluctuations
<b>Documented Cost</b>	Estimated \$2 - \$4 million (US) for 500 sites over 2-3 years in United Kingdom <sup>6</sup>
<b>Other Options</b>	There may be other chemical options, however, only two are permitted for aquatic use in the United Kingdom <sup>6</sup>
