Abstract

Surveys of nine species of summer wildlife made by rural residents in the five DNR administrative regions of the state of Wisconsin were compiled for 2017. On a statewide basis for the year of 2017 sightings have increased for three of the nine species; fox, ring-necked pheasant, and skunk. Sightings remained the same compared to last year for white-tailed deer, and wild turkey. Sightings decreased compared to last year for bobwhite quail, coyote, gray partridge, and ruffed grouse. In addition to statewide data, sightings are also tabulated for each of the five historical DNR administrative regions. Changes in reporting rates for the nine species were tested with χ² analysis. Analysis of variance was used to test for differences among years for two species.

Methods

Originally, names and addresses for this survey were chosen from a master list compiled in the early 1980’s with nonrespondents from previous years being systematically culled from the list. The size of the list, however, had become alarmingly small after the 1998 mailing. Consequently, an effort to increase the size of the mailing list was initiated in 1999. Landowners of 40 or more acres were selected from a mailing list from the University of Wisconsin Extension rural landowner list. Names and addresses were randomly drawn in proportion to ownership in each county. Active names from the previous master list were added to this new list, and nonrespondents are annually culled.

A mistake was made in the mailing process; in 2013 county codes were not included on the mailing label. Consequently, regional data was not analyzed for the 2013 Summer Wildlife Inquiry report.

Questionnaires were mailed in mid-August 2017 to 4,150 rural residents in the 5 DNR administrative regions in the state. Species reported include bobwhite quail, coyote, fox, gray partridge, ring-necked pheasant, ruffed grouse, skunk, white-tailed deer, and wild turkey. Species data were summarized using the Statistical Analysis System (SAS). Changes in annual (1988-2017) reporting rates of bobwhite quail, coyote, fox, gray partridge, ruffed grouse, skunk, and wild turkey were tested with χ² analysis. Analysis of variance was used to test for differences among years and regions in estimated numbers of pheasants and deer on rural properties.

Results

Responses were received from 1,486 rural Wisconsin landowners in 2017, representing a 36% return rate. Overall, during the past 30 years, 42,615 questionnaires have been returned. During 2017, the distribution of responses varied among DNR administrative regions accordingly:

Northern 16%   West Central 25%   Northeast 27%
South Central 21%   Southeast 11%
Bobwhite Quail
The statewide percentage of farmers that saw or heard bobwhite quail on their property varied significantly during the past 30 years (Figure 1, \( \chi^2 = 568.32 \), 28 df, \( P < 0.0001 \)). Bobwhite quail are reported more frequently in the West Central and South Central regions than in the other regions; however, observations statewide have decreased fairly steadily from 18% in 1988 to 5% in 2017.

Coyote
The percentage of respondents reporting coyote sightings changed significantly during 1988-2017 (Figure 2, \( \chi^2 = 2,161.99 \), 28 df, \( P < 0.0001 \)). Reported sightings of coyotes in 2017 decreased 2% on a statewide basis.

Fox
The percentage of respondents reporting fox sightings varied significantly during 1988-2017 (Figure 3, \( \chi^2 = 722.54 \), 28 df, \( P < 0.0001 \)). Generally, reported sighting rates have decreased since the inception of the survey. The statewide average number of litters reported for farms with foxes has remained relatively constant since 1988, averaging 1.4 fox litters per farm. The average number of litters per farm in 2017 was 1.4 as well.

Gray Partridge
Statewide, reported sightings of gray partridge on rural farms have decreased fairly steadily from 23% in 1988 to 4% in 2017 (Figure 4, \( \chi^2 = 1,076.39 \), 28 df, \( P < 0.0001 \)). The decrease in gray partridge sightings has been greatest in the Northeast region where reported sightings have decreased 94% during the past 30 years. Gray partridge have generally been reported more frequently in the Northeast and South Central regions than in the other regions.

Ring-necked Pheasant
Landowners were asked to estimate the total number of ring-necked pheasants (adults and young) on their property (Figure 5). Differences among regional trends in estimated pheasant numbers were significant (\( F = 107.45 \); 4, 36,796 df; \( P = < 0.0001 \)) with the highest numbers in the West Central region and the lowest numbers in the Northern region. Pheasant sightings also were different among years (\( F = 16.36 \); 29, 36,796 df; \( P = < 0.0001 \)). Mean pheasant sightings in 2017 increased 5% on a statewide basis.

Ruffed Grouse
Statewide sightings of ruffed grouse have been relatively decreasing since the beginning of the survey, from 44% in 1988 to 21% in 2017 (Figure 6, \( \chi^2 = 748.15 \), 28 df, \( P < 0.0001 \)).

Skunk
Statewide, reported skunk sightings during the summer months have generally been decreasing since the beginning of the survey (Figure 7, \( \chi^2 = 461.93 \), 28 df, \( P < 0.0001 \)). Reported sightings of skunks in 2017 increased 3% on a statewide basis.
White-tailed Deer
Statewide, the percent of rural landowners reporting sightings of deer on their properties has varied significantly between 1988 and 2017 (Figure 8, $\chi^2 = 86.31$, 28 df, $P =< 0.0001$). The average number of deer observed per property was calculated from those respondents who indicated having deer on their land (Figure 9). The number of deer observed varied significantly among years ($F = 19.14$; 28, 36,755 df; $P < 0.0001$) and among regions ($F = 170.73$; 4, 36,755 df; $P < 0.0001$). Deer sightings were higher in the Northern, West Central, and Northeast Regions than in the other 2 regions. The interaction of year and region effects was significant ($F = 3.04$; 115, 36,755 df; $P < 0.0001$). Mean deer sightings in 2017 increased 3% on a statewide basis.

Wild Turkey
Statewide, the percentage of respondents reporting sightings of wild turkey on their property has generally increased between 1988 and 2017 (Figure 10, $\chi^2 = 8,720.76$, 28 df, $P < 0.0001$). Reported sightings of wild turkeys in 2017 was 89% on a statewide basis.
