Doug,

After reviewing the total nutrient budgeting to Cedar L., the largest source of nutrient input appears to be runoff from poor land use activities in the watershed. The cost inhibiting aspects of controlling runoff seem too great at the present time. Suggestions of best land management practices by SCS, etc., seems to be the way to go. If macrophytes become a problem physical harvesting appears to be the way to go. In addition to the benefits you list I would like to add the immediate affect harvesting offers. Thank you for keeping us informed regarding your activities in the District.

Tim Rammer

P.S. I now have a dry suit, anytime Mirror or Shadow opines I'll be ready. Ron F. & Lee Karrow any also have some comments.
